PRODUCT CATALOGUE LINEAR BEARINGS AND SLIDES

PM is a high-end bearing and customised (mechatronic) system supplier, offering full vertical integration from (co-) engineering to production, assembly and qualification - all performed in-house.

INTRODUCTION

Since 1966, PM has been designing and manufacturing innovative, high-quality precision linear bearings and slides at our research and production facilities in the Netherlands. We specialise in delivering solutions to meet the unique demands of a wide range of industries. As a trusted partner to hundreds of global industry leaders, our clients span sectors such as semiconductors, medical technology, metrology, industrial automation, space, and defense.

COMPANY

The exceptional quality of PM products stems from our highly specialized manufacturing machinery and facilities. Our production facility is temperature-controlled and designed to minimize distortions caused by vibrations. Additionally, our precision rails are produced using customized, non-standard machinery. This commitment to quality makes PM an attractive supplier for various high-tech industries, including semiconductors, optics, and life sciences.

NEXT-GENERATION PRODUCTS

At PM, we continuously integrate the latest technologies to enhance the performance and functionality of the existing product range. This approach allows us to meet the ever evolving demands of high-tech industries, where precision, reliability, and compactness are critical.

Our clients value PM for our ability to engineer solutions that deliver maximum performance, even in the most space-constrained applications. Through ongoing innovation and refinement, we take proven designs to the next level, raising the bar for what's possible in precision motion.

The following product is a result of our commitment to meet the demands for next-generation equipment::

- **Miniature Slide MSR:** A compact linear slide designed for high load capacity in very limited spaces. It includes crossed roller bearings and an anti-cage creep mechanism. The slides are made entirely of stainless steel.

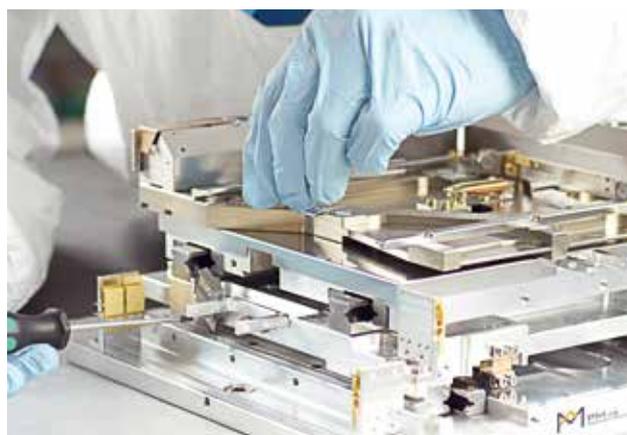

CUSTOMISED PARTS

In addition to offering high-quality standardised products, we design and manufacture engineered linear bearings and positioning systems meeting our clients' application-specific requirements.

PM combines the latest knowledge from its in-house R&D department, developments in manufacturing technology more widely as well as performance insights generated by industry deployment of precision applications.

Over the past 55 years PM has expanded its reach to serve a global client base. Our experienced, multilingual engineering and sales teams stand ready to work with you in realising your demanding projects.

Technical data in this catalogue is based on standard quality grade Q8 (no suffix). For higher quality grades please contact our product experts to discuss your requirements.

DISCLAIMER

This catalogue is the result of a comprehensive revision of its previous edition. It reflects the latest advancements in linear bearing technology, as well as insights gathered from industry applications. Any information from previous editions that does not correspond to the data in this current edition is, therefore, invalid. Due to the continuous development of our product range, we reserve the right to make modifications without prior notice.

-----	------------------------------

PRODUCT OVERVIEW

PM linear bearings are used as components across multiple industries worldwide. What truly sets PM products apart is their unparalleled quality and technical performance in terms of accuracy, exceptionally low friction, high rigidity, and long lifespan.

Our wide range of linear bearings provides maximum design flexibility, enabling play-free linear movement that is both cost-effective and optimally suited for its application. Popular linear bearings are also available as set packages, including essential components like cages, end pieces, and attachment screws. In the following pages, this catalogue presents these standard sets, specifying options for load capacity and stroke length.

Importantly, PM customers benefit from over 55 years of experience in the field of linear bearing manufacturing. As a result of our continuous testing and innovations, combined with new insights in engineering and manufacturing, our linear bearings are constantly being further optimized and often set industry benchmarks.

At PM, we are driven by our goal to lead the industry in quality and performance. With our expertise and manufacturing capabilities, we can supply custom-made linear bearings and linear slides.

Whether you choose a standard product from this catalogue or a customized component that meets your specific needs, we deliver only top quality.

1. LINEAR BEARINGS TYPE RSD

- Equipped with balls or rollers
- For light up to medium load
- Available in size 1.5 - 24 mm
- Lengths from 20 - 1400 mm
- Also available as a set, see page 41

2. LINEAR BEARINGS TYPE RSDE

- Equipped with rollers, size 3 – 9 mm
- For precision applications
- For medium up to high loads
- Anti-cage creep technology optional
- Also available as a set, see page 57

3. LINEAR BEARINGS TYPE RNG

- Equipped with rollers 4 and 6 mm
- Very compact design and high load ratings
- Offers reduced weight
- Anti-cage creep technology optional
- Also available as a set, page 67

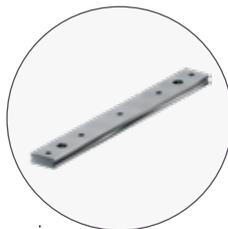

4. LINEAR BEARINGS TYPE N/O AND M/V

- Equipped with needle rollers
- Best load ratings and maximum rigidity
- Lengths from 100 - 1200 mm
- Anti-cage creep technology optional

5. DOUBLE PRISM TYPE DS

- Compact design
- Can be combined with RSD linear bearings and recirculating units UK and UR
- Available in size 2 - 15 mm
- Lengths up to 1400 mm

6. RECIRCULATING UNITS TYPE UK AND UR

- For unlimited travel
- Low profile and space-saving design
- Equipped with balls (UK) or rollers (UR)
- Available in size 2 - 15 mm

TECHNICAL SPECIFICATIONS

GENERAL

PM linear bearings and frictionless precision slides are available in various models, with ball and roller diameters offered in many standard lengths and sizes.

The range of sizes and lengths covers virtually all industry applications, allowing designers to solve most challenges related to frictionless linear movement with adjustable preloads. Additionally, PM linear bearings are virtually wear-free and require minimal lubrication or maintenance (specific conditions of use should be considered for each application).

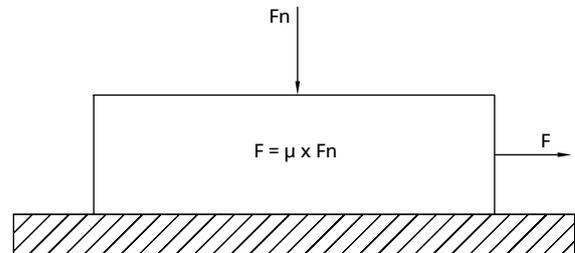

Application fields include:

- Semiconductor industry
- Machine tools
- Automation technology
- Measuring machines and microscopy
- Optical devices

PM linear bearings are available in compact dimensions, offering high accuracy of movement and durability, resulting in lower maintenance costs. The parts are designed to be easily interchangeable in case of wear. Since linear bearings and slides are critical components in many applications, they are manufactured with the utmost care to ensure maximum linear accuracy and reliability.

FRICITION

Friction is the mechanical resistance created by the process of one moving surface or object when coming into contact with another. A smoothly grinded surface has the beneficial effect of reducing the level of friction. PM uses the highest quality of rollers in combination with precision ground rails which are manufactured by our own team of specialists.

μ = Coefficient of friction

F_n = Normal force

F = Frictional resistance

Note: The use of wipers and seals increases friction.

LUBRICATION

PM linear bearings are a key component in the construction of machines. The standard of high-quality has to be maintained for the duration of the calculated lifetime (page 11). The linear bearings have to be protected against contaminated environments. Lubrication creates a film between rolling surfaces and helps to protect against corrosion. Other benefits are for example:

- Friction reduction
- Reduction of wear
- Extended lifetime
- Heat reduction

We prefer to use lubrication by CLP oil, such as DIN 51519 and HLP oil, such as DIN 51524. Assuming viscosity values between ISO-VG15 and ISO-VG100. In case of grease, the use of a lubricant on a lithium soap basis is recommended. Lubrication is a factor to be taken into account when using PM linear bearings, due to components being manufactured from non-standardised materials and their potential for use in highly specialised operational environments. Please contact us if you require further information.

MATERIALS

The rails are made of tool steel 1.2842 or bearing steel 1.3505, through-hardened between 58 and 62 HRC. The rolling elements are made of bearing steel 1.3505 and have a hardness between 60 and 64 HRC. For applications which require stainless steel, the rails and rolling elements are made of 1.4034 or 1.4112, through-hardened between 54 and 57 HRC. End screws are nickel plated

CAGES

Depending on the type and size of the linear bearing, different cage types are available. In applications with high operating temperatures or extreme operating conditions PM is able to supply customised cages. Please contact a PM advisor to discuss requirements for your application.

CHARACTERISTICS OF CAGES

Cages in precision rails have a wide range of different purposes:

- They maintain appropriate distance between rolling elements, prevent their mutual contact and thus reduce friction
- They ensure an even distribution of rolling elements, thus resulting in a smooth run
- They guide the rolling elements, in the unloaded zone of a rail and thus improve rolling conditions to prevent detrimental sliding movements from occurring

CAGES FOR RSD AND DS RAILS

Cylindrical roller cages

AA-cages: steel cages with retained rollers.

Available to order with all rail sizes.

Suitable for horizontal application.

Available in stainless steel with order code AA-SS with cage body made out of stainless steel or nickel plated and rollers made of stainless steel.

AL-cages: starting from 4 mm to 12 mm. Cage body made from aluminium with retained rollers. Suitable for horizontal and vertical application. Cage is suitable for overrunning use. Due to its low-weight properties and low friction coefficient, this cage is suitable for a wide range of applications.

KZR-cages: plastic cages with retained rollers. Size 1.5 and 2 mm are made from POM (polyacetylene), other sizes are made from reinforced PA12 glass fibre.

For size 6 and 9 mm, a strong design cage featuring two stainless steel wires in the interior of the cage design is available as an option. The KZR cage is characterised by its low weight and smooth running and sliding quality.

Ball cages

JJ-cages: solid brass ball cages for horizontal and vertical application. Available for size 1.5 – 24 mm, from size 6 mm upwards available with retained balls. This cage is extremely durable, reliable and has low-friction properties.

KCLK-cages: plastic ball cages with retained balls. Size 1, 2 and 3 mm is made of POM (polyacetylene). Other sizes are made of reinforced PA12 glass fibre (30% GF).

CAGES FOR RSDE AND RNG RAILS

Cylindrical roller cages

KRE-cages: POM cages for size 3 to 6 mm with retained rollers. Suitable for horizontal and vertical application. For overrunning cages purposes please consult a PM advisor.

KREV-cages: PEEK (polyether ether ketone) cages are available in size 4 and 6 mm with retained rollers. They are often used in vacuum and ultra-high vacuum applications and suited for horizontal and vertical applications. Also suitable for high accelerations and high operating temperatures. For overrunning cages purposes please consult a PM advisor.

OPERATING TEMPERATURE

PM linear bearings are capable of operating in temperature of +120 °C. For linear bearings with plastic components, the operating temperature range is -40 °C to 80 °C. In case of any doubt or when using motors, ball screws, measuring systems, etc., please contact us.

Operating environments that have temperature conditions falling outside the usual range (i.e. either lower or higher than usual) require that specific demands for the rails, cages and lubricant are taken into consideration. Both material and mechanical properties change under the influence of temperature, reducing the lifetime of the linear bearing and affecting the running properties. In addition, the attachment screws are subject to thermal stress. If the above is applicable, please contact a PM product expert to discuss an appropriate solution.

PACKAGING

PM products can either be delivered packed as a set or as single components. The rails and roller cages are delivered with an oil-based corrosion protection. Before assembly, the product should be cleaned to remove the corrosion protection oil from the rails and roller cages. Subsequently and prior to operation, they should be lubricated with oil or grease in accordance with lubrication instructions provided by PM.

CERAMIC LINEAR BEARINGS

For decades, PM has supplied linear bearings made out of full ceramic as well as hybrid versions. Hybrid linear bearings are supplied with stainless steel rails and rolling elements made of ceramic, often Si_3N_4 . The cages used are usually made of PEEK material. Hybrid offers great advantages in high dynamic applications where stiffness, reliability, precision, very low friction and long service life are required.

Full ceramic rails are used in applications where properties such as non-magnetic, high temperature, dry running and low weight are required.

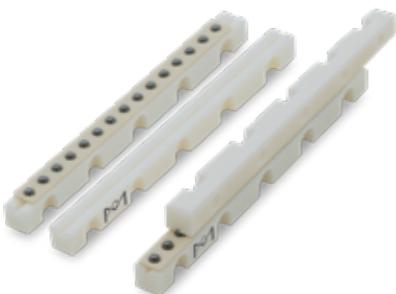

For ceramic rails the following materials are available:

- Silicon nitride (Si_3N_4), article code CRS
- Zirconium oxide (ZrO_2), article code CRZ
- Alumina oxide (Al_2O_3), article code CRA

Consult a PM advisor for assistance in selecting the right material and for design considerations.

Applications of ceramics:

- Medical technology, e.g. magnetic resonance imaging (MRI)
- Electron microscopy
- Semiconductor industry - Bonding machines
- Cryogenic environment

HIGH VACUUM AND UHV APPLICATION

The semiconductor industry as well as medical and research laboratories require linear rails that do not contaminate the vacuum. Choice of material and modifications such as vented holes and special lubricants are among the many considerations when delivering applications for these industries. Upon request, PM is able to deliver items UHV-cleaned and double-packaged, or according to your specific instructions.

EXPECTED LIFETIME

LOAD RATINGS AND EXPECTED LIFETIME

The cylinder and needle rollers we use are compliant with DIN ISO standard 14728-1: 2017. The listed ratings are based on an expected service life L_{10} of 100.000 m.

Some suppliers, mostly from the Far East, use higher loadings based on an expected service life of 50.000 m ($=L_{50}$). These C_{50} values can be converted using the following formula according to L_{10} values:

Conversion of the load ratings to L_{50}

Ball cage guide $C_{50} = 1.26 \cdot C_{100}$

Cylinder and needle roller cage guide $C_{50} = 1.23 \cdot C_{100}$

Conversion of the load ratings to L_{100}

Ball cage guide $C_{100} = 0.79 \cdot C_{50}$

Cylinder and needle roller cage guide $C_{100} = 0.81 \cdot C_{50}$

FATIGUE

Fatigue is a surface-pitting type failure resulting from built-up stress caused by contact between moving surfaces. A loaded surface typically moves over another surface, e.g. in a rolling motion, the rolling elements move over the rail V-grooves. The end of the rolling contact life is reached when the built-up stress causes the material to crack and the contact surface shows damage and "pitting". "Pitting" as a function of running time is commonly seen in the running surfaces or in the rolling elements, thus resulting in pitting in the material. Different variables can have an impact on material fatigue, for example:

- Load applied onto rails
- Amount of acceleration and speed
- Quality and age of the lubricant

SHORT STROKE

"Short stroke" can occur as a consequence of the specific rail and roller size, cage type and travel distance. If the rolling elements fail to roll completely and stroke $H < \text{diameter } D$, this is referred to as "short stroke". It can result in the surface being compressed, and in combination with very high-frequency strokes this can result in cracks in the lubrication film causing steel-on-steel contact. In either case, the precision rails accuracy and lifetime are negatively affected. To re-instate a lubrication film between the rolling element and the running surface, one or more lubrication strokes (service strokes) should be applied. As a minimum, the recommended stroke H should be greater than the diameter of the rolling element.

NOMINAL OPERATIONAL CALCULATION LIFE (L_{10})

We refer to the amount of time during which the performance of the linear bearing is satisfactory as the expected lifetime. The calculation below can be used to estimate the expected lifetime for linear bearings – assuming that PM's recommendations regarding operating conditions, lubrication and protection from contaminants are being followed.

By definition, within the expected lifetime and under similar operating conditions, 10% of the linear bearings will not attain the lifetime under the dynamic load C_{dyn} , as listed in below table.

$$L_{10} = a_1 \cdot (C_{dyn}/P)^E \cdot 1.15 \cdot F_T \cdot F_H \cdot 10^5 \text{ Meters}$$

L = Expected life in meters

a_1 = Reliability factor

C_{dyn} = Effective dynamic load rating in N

P = Equivalent load in N

E = 10/3 for cylinder and needle rollers, or 3 for balls

1.15 = An empirical factor applicable to the materials employed

F_T = Correction factor for temperature effects

F_H = Correction factor for rail hardness grades (below 58 HRC)

Reliability factor		
Reliability (%)	L_n	a_1
70	L30	2.77
80	L20	1.82
90	L10	1.00
95	L5	0.62
96	L4	0.53
97	L3	0.44
98	L2	0.33
99	L1	0.21

TEMPERATURE FACTOR F_T

Diminished rail hardness will start to occur in linear bearings when deployed at temperatures over 150 °C. As a result, load ratings must be reduced with a factor F_T as shown in the table below. This applies to the reduction of the dynamic load rating C_{dyn} and the static load rating C_o .

Temperature in °C	Temperature factor F_T
125	1.00
150	1.00
175	0.95
200	0.90
225	0.82
250	0.76
275	0.68
300	0.61

HARDNESS FACTOR F_H

The rails have a minimum hardness value of 58 HRC, corresponding to hardness factor $F_H=1$. The table below shows the applicable amount of reduction in load capacity in the case of stainless steel rails which have lower hardness values. For example, rails made of stainless steel 1.4034 have a minimum hardness of 54 HRC, whilst the hardness factor $F_H = 0.75$.

Rockwell HRC	Hardness		Hardness factor F_H
	Vickers HV	Brinell HB	
60	697	-	1.00
59	674	-	1.00
58	653	-	1.00
57	633	-	0.96
56	613	-	0.89
55	595	-	0.81
54	577	-	0.75
53	560	-	0.71
52	544	500	0.67
51	528	487	0.63
50	513	475	0.60
40	392	371	0.30
30	302	286	0.20
20	238	226	0.10
10	196	187	0.07

Load ratings specified in this catalogue are based on a Rockwell hardness of 58 HRC.

DYNAMIC AND STATIC LOAD RATINGS

15	420	420	JJ	RSD

STATIC SAFETY FACTOR

The static safety factor S_0 determines the degree of safety against permanent deformation of the contact surfaces of the rails and rolling elements. The safety factor represents the relationship between the basic static load rating C_0 and the equivalent maximum static load P_0 and can be calculated using the following formula:

$$S_0 = \frac{C_0}{P_0}$$

The static equivalent load P_0 is a hypothetical load and is considered to be approximately the maximum applied load F_{\max} , as:

$$P_0 = F_{\max}$$

- C_0 = Static load capacity (N), see dimension slides
- P_0 = Static equivalent load (N)
- F_{\max} = Maximum applied load (N)
- S_0 = Static safety factor

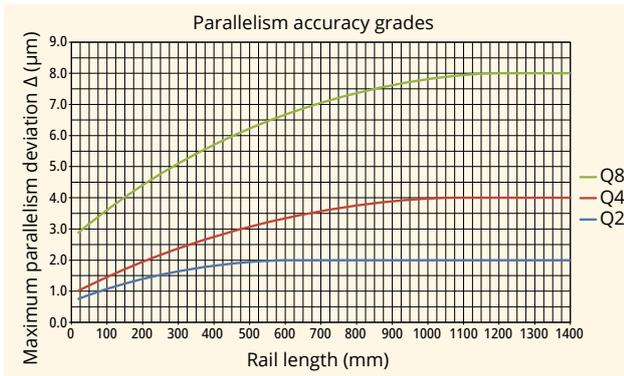

In use cases where high importance is placed on running accuracy and smoothness, a static $S_0 \leq 2$ should be applied. If not, under normal conditions S_0 should be between 2 and 4. For general machinery with loads subject to variable operating conditions, medium vibrations or heavy impact loading on the linear bearings, a static safety factor S_0 between 4 and 5 is recommended.

DESIGN INFORMATION

ACCURACY GRADES

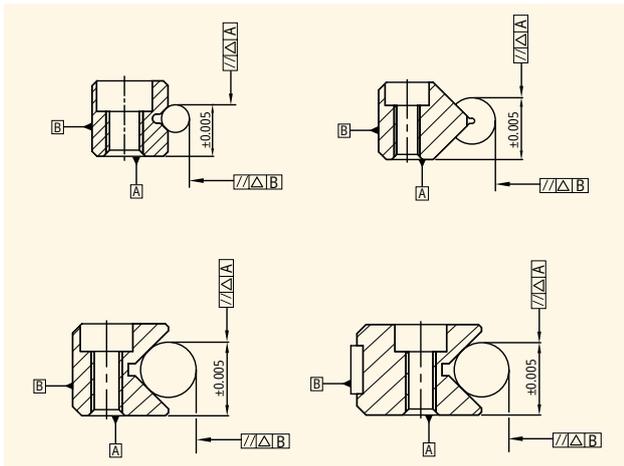

The linear bearings manufactured by PM come in three grades of quality. The quality grade refers to the degree of parallelism between the running surfaces and reference surfaces A and B of the rail, as illustrated in graph and figure below.

- Q8: Standard precision grade, is suitable for most machine requirements
- Q4: Meets the demands for high precision applications
- Q2: Suitable for the highest accuracy requirements

If accuracy grade Q4 or Q2 is required for your order, please add a suffix "Q4" or "Q2" to the rail type number (for example: RSD-6300-Q4).
Higher accuracies can be supplied on request. If applicable, please consult your PM advisor.

In order to achieve high running accuracy, PM linear bearings are very tightly toleranced (± 0.005 mm). This also means PM linear bearings can be deployed individually, making it unnecessary to include any identification markers on the rails.

SF-GRADE; SUPER FINISH GRADE

New technologies require tighter tolerances and higher speeds. Linear bearings finished in SF-Grade meet this requirement and provide outstanding performances for ultra-fine precision equipments.

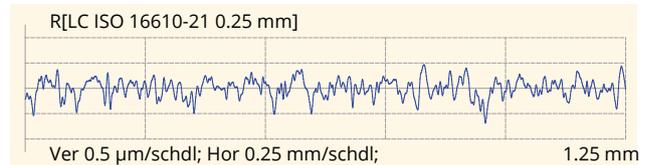

Key features are:

- Reduction of surface roughness <0.05 Ra
- Rail V-groove surfaces obtain mirror finishing through smooth grinding
- Vibrations in sub-micron area are significantly reduced
- Further reduction of friction which results in a more smooth running linear motion

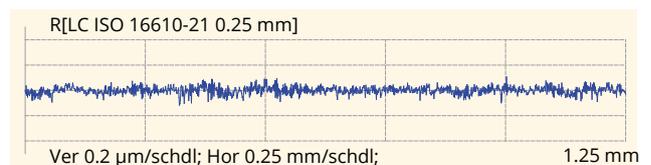

Your advantages:

- Low wear results in longer lifetime
- Virtually friction-free
- Higher rigidity
- Allows microscopic precision positioning

Standard finish

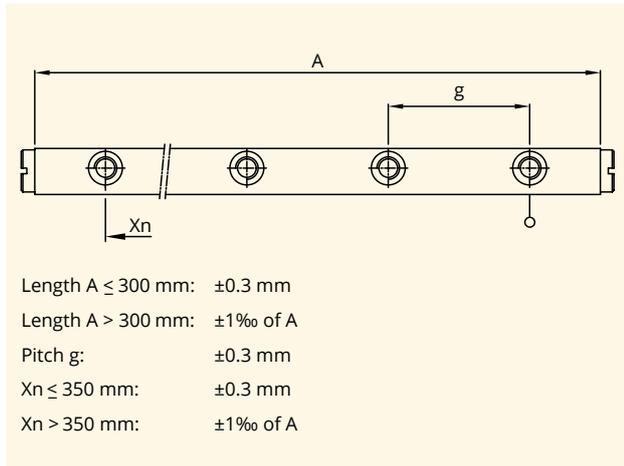

SF-Grade finish

Ideal applications for linear bearings in SF-Grade include wire bonding stages, measuring devices, material testing equipments, microscope stages and manipulators. Please contact us to discuss appropriate use of a lubricant that suits your specific needs.

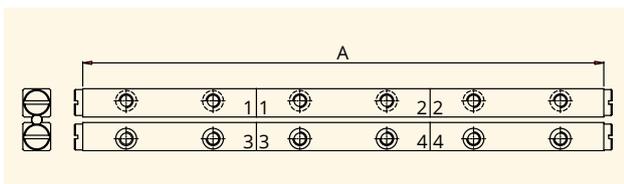

TOLERANCES ON LENGTH AND MOUNTING HOLES

MULTI-SECTION RAILS

Rails exceeding the maximum length of 1400 mm will be composed of different sections that are ground together. The offset between the raceways is max. 2 micron. The rails are provided with end markings for assembly. The tolerance on length (A) is within ± 2 mm.

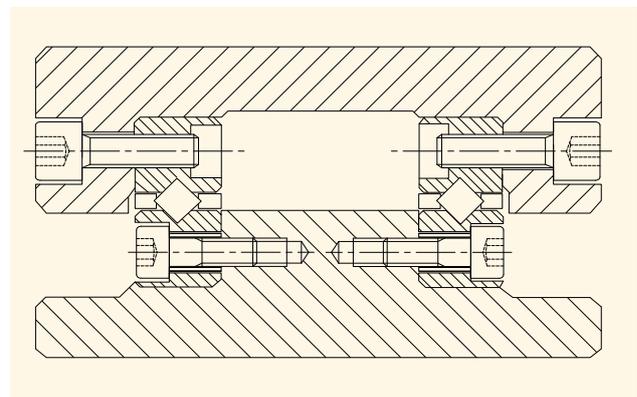

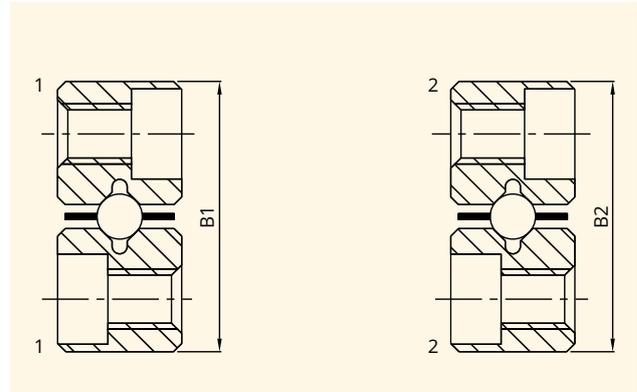

During installation pay attention to the consecutive numbering on the rails.

MATCHED PAIRS

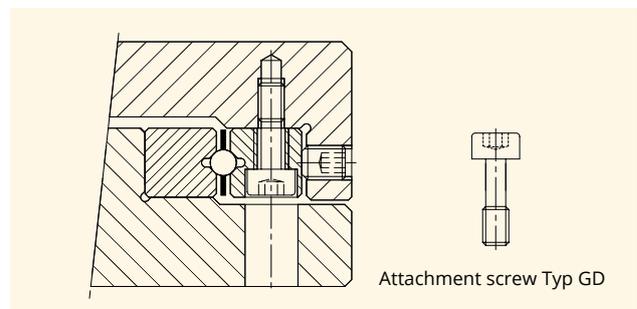

For gravity-loaded rails that are matched, the tolerance level on height B for B1 to B2 is ± 0.01 mm, and the pairs are marked. If several sets are ordered they will be marked accordingly.

In case of UK/UR recirculating elements, if two or more are arranged one behind another in the application, we recommend ordering matched pairs by adding a suffix "MP" in your order note.

ASSEMBLY OF THE RAILS

When using threaded holes in the rails for assembly, special type GD attachment screws with a smaller shaft can be used for the adjustable rail. After inserting the cages between the rails, the linear bearing set needs some adjustment to eliminate play. The adjustable rail will move slowly to the other rail, thus requiring GD screws which allow for additional clearance in the mounting holes.

HEIGHT DIFFERENCE ΔH

To achieve best performance and for an even distribution of the load over the rolling elements the offset between mounting surfaces for the linear bearings should be within the calculated value offset ΔH .

The ΔH is calculated according to the following formulas.
For rails with crossed roller cages:

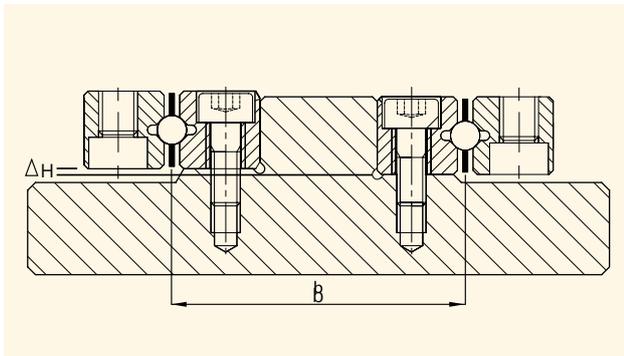

$$\Delta H < 0.1 \cdot b$$

For rails with needle roller cages:

$$\Delta H < 0.07 \cdot b$$

ΔH (μm): Maximum permissible deviation from the theoretically correct position

b (mm): Centre distances of the bearings

TOLERANCES OF MOUNTING SURFACE

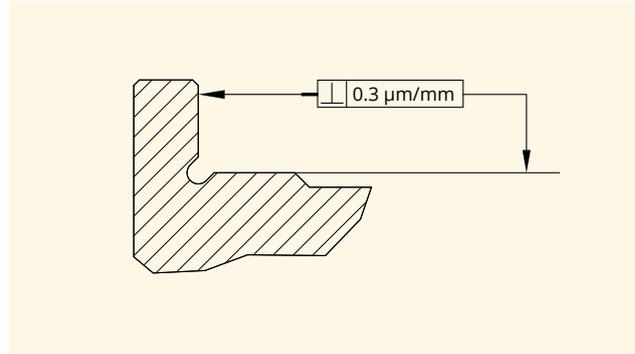

For standard applications an average mounting surface roughness of $R_a 1.6$ must be observed. For quality classes Q4 and Q2 the mounting surface roughness values are $R_a 0.8$ and 0.2 .

To achieve precision of the system the rails must be pushed against the mounting surface and reference shoulder.

To achieve best performance, the bearings must be mounted on rigid and fine-machined, (preferably grinded) flat surfaces and be supported over their entire length.

ANGULAR ERRORS

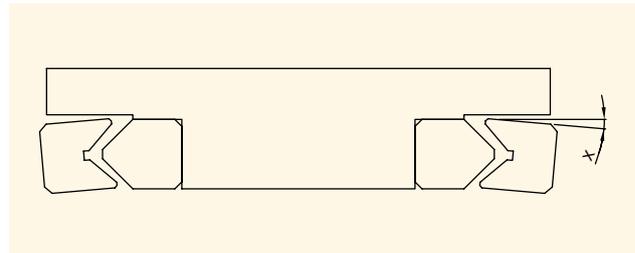

The mounting and reference shoulder surfaces must be square to each other, with a maximum angular error of $0.3 \mu\text{m}/\text{mm}$. The rails must be parallel to each other to prevent local overloading of rollers and dislocation of the cage. For applications with high accelerations we recommend the use of our anti-cage creep mechanism so as to prevent creeping of the cage out of its original position. Please see page 88 and 89 of this catalogue.

The tolerance of linear bearings in loaded or unloaded situations should not exceed the following values:

Balls or rollers (RSD / RSDE / RNG) $0.3 \mu\text{m}/\text{mm}$

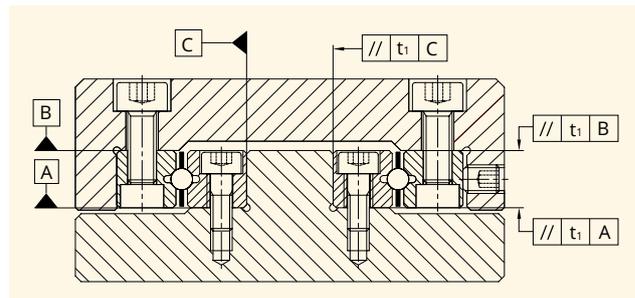

Needles (N/O / M/V) $0.1 \mu\text{m}/\text{mm}$

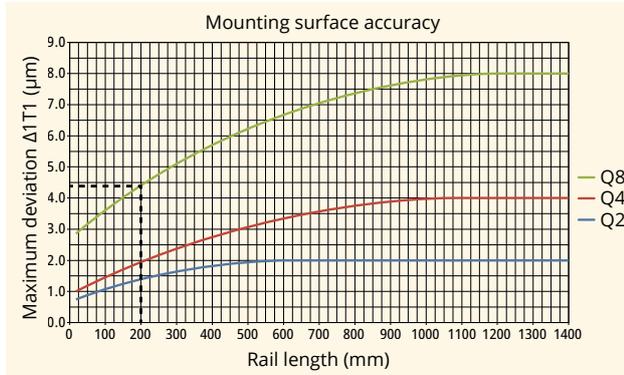

PARALLELISM OF MOUNTING SURFACES

The final assembly accuracy of a linear slide depends on the quality and accuracy of the supporting structure on which the rails are mounted. The parallelism of the mounting en reference surfaces must not exceed the tolerances as illustrated in below graph. Please refer also to the quality grade of the linear bearing sets to read the maximum permissible tolerance. Most common is Q8 which is the standard (normal) quality grade.

For example -> by a rail length of 200 mm the maximum permissible tolerance is 4.4 microns.

Deviations from the listed tolerances reduce the running accuracy and service life of the linear bearing.

RECOMMENDED STROKE LENGTH 'H'

As regards cage length and the associated load capacity, PM recommends a stroke length (H) of 70% of the (longest) rail length (A). In case the rail length is longer than 400 mm the stroke length can be increased up to a maximum of 100%.

$$H/A \leq 0.7 \text{ (for } H \leq 400 \text{ mm)}$$

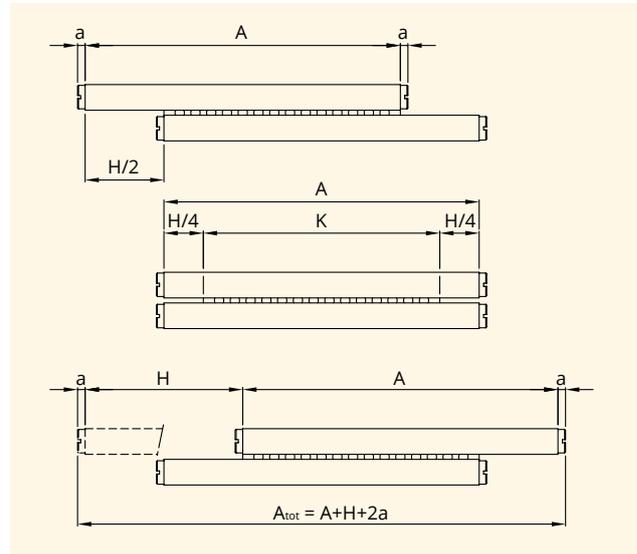

$$H/A \leq 1 \text{ (for } H > 400 \text{ mm)}$$

CALCULATION OF THE CAGE LENGTH 'K'

Cages travel at half the speed of moving rails and through half the distance i.e.: the stroke of the cage equals half the stroke of the moving bearing member or the slide top.

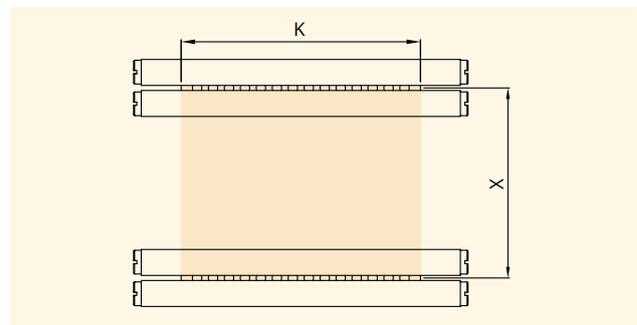

On the other hand, with a normal frictionless sliding table, the upper member can move equal distances to either side of the center.

K = A-H/2 (i.e.: cage length = rail length - half of the max. stroke)

Relationship between cage length and distance between rails (x);

$$\frac{K}{X} \geq 1$$

- K = Cage length
- H = Stroke / travel
- A = Rail length
- A_{tot} = Overall length
- X = Rail distance
- a = End screw

LOAD CAPACITY 'C' USING ROLLERS

Standard constructions with rollers: two roller cages, each in between rails of equal length, both longer than the cage.

$$C_{total} = Z \cdot C_{roller} \cdot \frac{1}{2} \text{ (amount of rollers} \cdot C_{dyn} \text{ per roller).}$$

Normally only half of the total number of rollers will have load on them; the other half resists possible lift-off forces. There is one exception: all rollers will be loaded if a pair of rails is installed horizontal, but one above the other, with the V-groove of the lower rail facing up and that of the upper rail facing down; i.e.: in the direction of the applied load, assumed here to be vertical.

For example: assuming a normal horizontal application, with two roller cages:
R3x22AA; Z = 22 and C_{dyn} roller = 136 N per roller.
 C_{dyn} total = $(22 \cdot 2 \cdot 136) / 2 = 2992$ N.

LOAD CAPACITY 'C' USING BALLS

A standard construction with balls consists of two ball cages, each interposed between rails of equal length, each longer than the cage.

$$C_{total} = Z \times C_{ball}$$

C_{total} = Total dynamic load capacity

Z = Amount of rolling elements

C_{ball} = C_{dyn} per ball

Note: all the balls in the cages are load bearing.

$C_{total} = Z \times C_{ball}$ = (no. of balls) x (dynamic load rating per ball).

Example: cage K3 x 23JJ; Z = 23; C_{dyn} = 30 N per ball.

$C_{total} = 23 \times 2 \times 30 = 1380$ N.

CALCULATION OF NUMBER OF ROLLING ELEMENTS 'Z'

$$Z = \frac{K}{t}$$

Z = Amount of rolling elements

K = Cage length

t = Pitch between rolling elements

Example

K = 200 mm (cage length)

t = 5 mm (for 3 mm diameter rollers / balls)

Z = $200 / 5 = 40$ rollers or balls

See load capacity table on page 12.

CAGE DESIGNATION

AA cage; R3x40AA; roller size = 3 mm; 40 rollers; for horizontal application only.

AL cage; R6x18AL; roller size = 6 mm; 18 rollers; horizontal and vertical application.

JJ cage; K3x20JJ; balls size = 3 mm; 20 balls; horizontal and vertical application.

SEALING

The rails must be kept clean at all times in order to prevent damage to the linear bearing. If the rails are subjected to contaminants, the use of telescopic bellows, covers or other shields is recommended.

END PIECES

End pieces prevent the cage from moving out of the load zone. In order to ensure the quality of the rails during operation, it is necessary to protect the rails against contaminations. For this purpose, end pieces with type GCA wipers are available which are mounted over the end holes in the rails.

Type GC end pieces are also suitable for linear bearing sets with combined rail lengths where the type GC end piece will be mounted in the longest rail.

MAXIMUM VELOCITY AND ACCELERATION

PM linear bearings that are correctly mounted and preloaded should not exceed the following values, unless the design and the application are adapted for higher dynamics*:

RSD type linear bearings

Max. recommended speed $v = 50$ m/min.

Max. acceleration $a = 8$ m/sec².

RSDE and RNG type linear bearings

Max. recommended speed $v = 50$ m/min.

Max. acceleration $a = 25$ m/sec².

RSDE and RNG type with anti-cage creep (ACC) solution

Max. recommended speed $v = 150$ m/min.

Max. acceleration $a = 300$ m/sec².

N/O and M/V type linear bearings

Max. recommended speed $v = 50$ m/min.

Max. acceleration $a = 50$ m/sec².

(depending on the cage type used).

UK and UR type recirculating units

Max. recommended speed $v = 50$ m/min.

Max. acceleration $a = 50$ m/sec².

To achieve the above mentioned values for maximum acceleration and speed without skidding of balls and rollers (which could result in cage creeping), it is necessary to have a correct assembly procedure with the appropriate preload settings in place. Please contact PM to obtain our expert guidance on preload settings.

*In this situation PM design expertise support and approval is required.

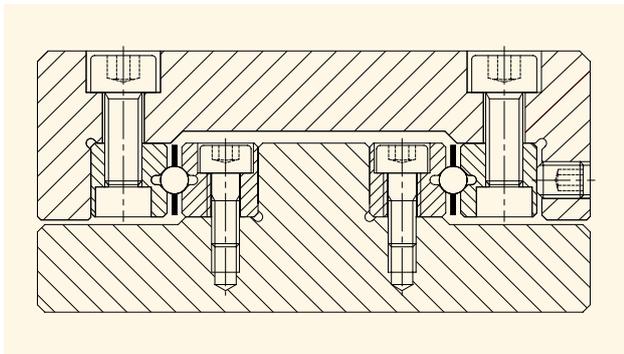

ASSEMBLY INSTRUCTIONS

One set of linear bearings consists of 4 pcs. rails (2 pairs), 2 pcs. cages and 8 pcs. end screws or end pieces.

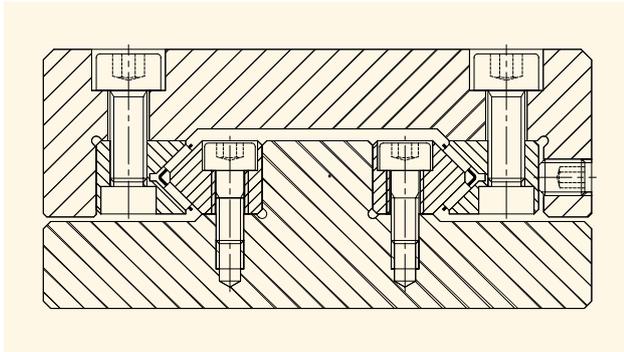

STANDARD FITTING EXAMPLES

Our range of linear bearing components can be positioned in any spatial orientation or direction required for your application. Rails can be attached to the slide base construction either using the threaded holes or using the through holes.

Use of RSD, RSDE or RNG

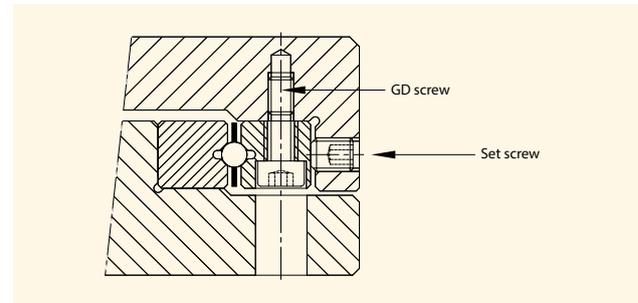

Use of N/O or MV

PRELOAD SETTINGS

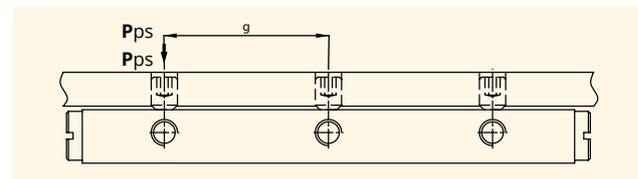

In order to assure a play-free movement and to increase the stiffness and accuracy of the linear bearing, preload adjustment is necessary. To adjust the preload uniformly, PM supplies especially designed type GD attachment screws. These screws are recommended for use with the through holes of the rail and the threaded holes in the slide members. Type GD screws allow for additional clearance in the mounting holes for the preload rail.

Example: Use of a type GD attachment screw

The smoothest running performance can be obtained by adjusting the preload set screws (ISO 4026, DIN 913) opposite the rollers. By moving the slide, each of the preload set screws can be adjusted. In applications where the cage runs outside the rails it is the shorter rail that has to be preloaded. For each mounting screw along the rail length one preload screw should be used.

The size of the preload set screw depends on the size of the rail (table 1 - 5, page 23). It can be fine adjusted by the use of a torque wrench.

The amount of preload depends on the size of the rail and the rigidity of the base construction. Based on our experience we recommend that the amount of preload, under normal conditions, is set between 2% to 20% of the permissible load C . For linear bearings type N/O we advise 2.5% C .

Under normal operating conditions, the recommended preload settings can be selected from table 1 - 5 on page 23.

AMOUNT OF PRELOAD FORCE

A calculation example of preload torque P_{ps} and the resulting preload force is provided here:

- Rail RSDE-3150; $g = 25 \text{ mm}$
- Roller cage type KRE-3; $t = 3.3 \text{ mm}$, $C_{dyn} = 392 \text{ N}$
- Attachment screw M4
- Factor f (for rollers = 1; for balls / needles = 2); $f = 1$
- Amount of preload p ; $p = 8\%$
- Factor a in cm (please refer to the table on the next page)

Set screw	Factor a
M2	0.0238
M2.5	0.0294
M3	0.0350
M4	0.0469
M5	0.0580
M6	0.0699
M8	0.0926
M10	0.1152
M12	0.1378
M14	0.1591
M16	0.1811

Calculation amount of force per set screw

$$P_{ps} = g / t \cdot C_{dyn} \cdot p / 100 \cdot f$$

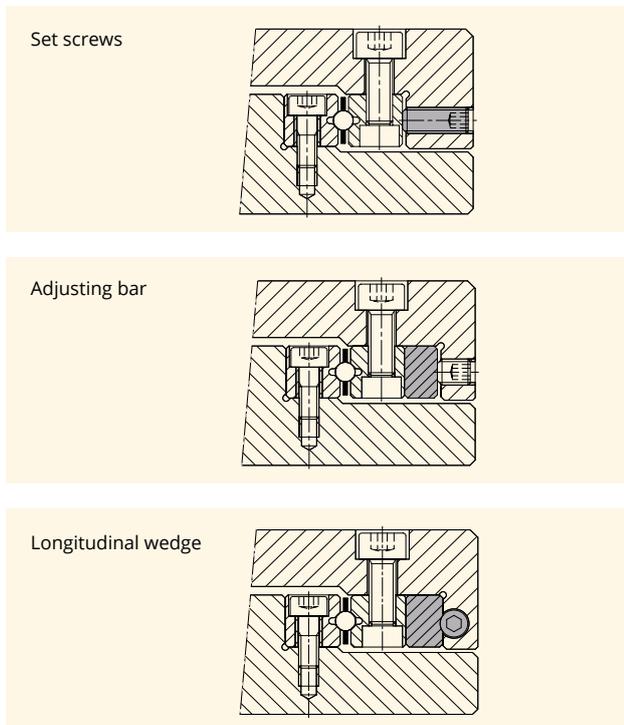

$$P_{ps} = 25 / 3.3 \cdot 392 \cdot 8 / 100 \cdot 1 = 237,6 \text{ N}$$

Calculation tightening torque on set screw

$$\text{Tightening torque} = P_{ps} \cdot a$$

$$\text{Tightening torque} = 237,6 \cdot 0.0469 = 11,14 \text{ Ncm}$$

The following figures illustrate typical methods used for applying preload.

Note: The friction in the screw connection affects the final preload force that the set screw will generate. The amount of this friction depends on the material of the table components and any lubrication of the screws. Therefore, the friction factor is unknown and not included in the formula.

RECOMMENDED STROKE LIMITING

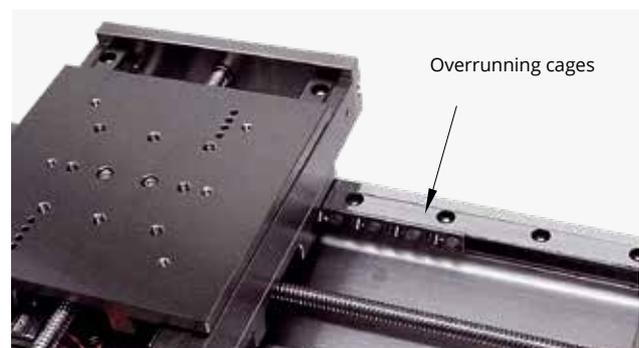

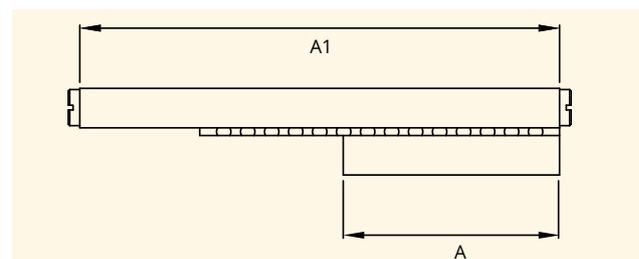

The stroke must be limited either by the machine parts or by using limit switches. Cages may never be used as stroke limit. If they are, they can damage the running surface of the rails. Therefore we recommend the use of emergency hard stops which should be mounted in line with the bearing axis to prevent additional loads and moments on the linear bearings.

OVERRUNNING CAGES

Overrunning cages are used when a shorter slide moves over a longer rail. As the use of end pieces is not possible for the short rails, which get mounted in the moving slide, the short rails should be ordered with rounded inlets (please add a suffix "RI" in your order note). Rounded inlets enable the rollers to move in and out of the preload smoothly. For the longer rails we recommend type GB and GC end pieces. Not all cages are suitable for overrunning use, as the cage material and length geometry must be taken into account. Please consult a PM expert for advice, or refer to the specifications provided for each type.

As a general guideline the permissible application ratio A to A1 is determined as follows:

- For fixed rails 1 : 2
- For laid on rails 1 : 4

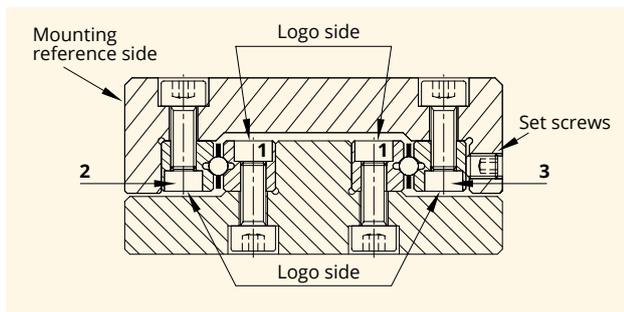

ASSEMBLY PROCEDURE

PRIOR TO ASSEMBLY

PM linear bearings are precision components; they have to be handled with meticulous care. To achieve a perfect linear bearing, it is necessary to respect the following guidelines:

- When handling the components. Damage on the rail surface will impact the running performance and operational lifetime
- Prevent contact with any foreign materials when mounting the rails
- During assembly, ensure that all linear bearing components have the same temperature
- For uniform tightening of the bolts the use of a torque screw driver is recommended. Various models are available.

ASSEMBLY LINEAR BEARINGS

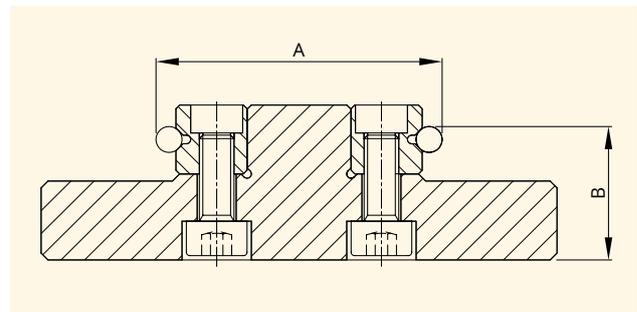

For satisfactory installation of all types of linear bearings in this catalogue, it is necessary to consider the following points:

- 1) To determine the location of fixing holes in the support structure (slide base) the holes in the rails should be taken as a reference and "copied" onto the support structure. This is highly desirable as the original pitch of individual holes may have altered during hardening by as much as 0.4 mm. To compensate this, special type GD or GDN attachment screws can be supplied. The dimensions of these screws are listed in the tables at the end of each chapter.
- 2) Carefully de-burr and clean all elements, to ensure a flat surface and a perfect fit of the rails.
- 3) Now, as a required first step, to fasten the inner rail pair (marked as 1 in figure above) the base and reference face 1 of the linear bearing rails should be lightly oiled before they are clamped against the mounting and reference shoulder. Subsequently,

they can be fastened by starting from one end and working towards the opposite end. We advise the use of a torque wrench. Please note that the company logo and item number are marked opposite to the surface reference.

- 4) Parallelism of the V-groove of the rails (A and B) should be checked to ensure they don't exceed the tolerance of the linear bearings (page 14). After these steps have been followed, the slide element is ready for assembly.

Parallelism of rails V-groove: ΔA and ΔB

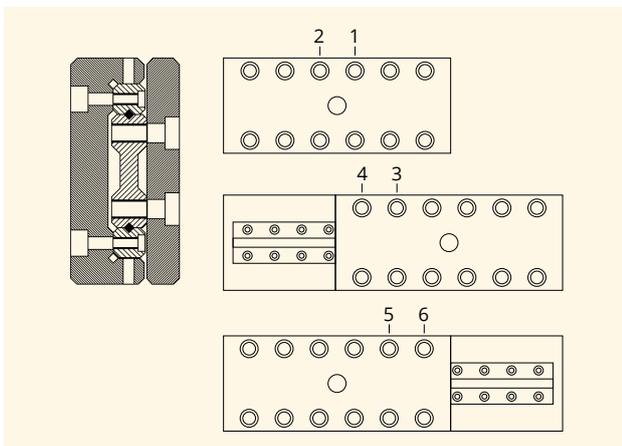

- 4.1) The fixed bearing rail (2) should be mounted as described under step 3 above, but care should be taken not to tighten the adjustable rail (marked as 3 in figure on the left side) too much, so as to leave a gap between the V-grooves for the insertion of ball cages, roller cages or needle cages.
- 5) If any end stop screws are present, remove them now.
- 6) Carefully insert the cages. When placed in their exact position, lightly secure the adjustable rail until the screws are finger-tight.
- 7) Fit the end screws or end pieces, and wipers.
- 8.1) The linear bearing set is now ready to be backlash free-adjusted using the lateral preload set screws (page 19, Preload Settings). The amount of preload is given in the tables at page 23. The use of a torque wrench is advised.
- 8.2) Before starting the preload procedure carefully move the slide top over its stroke length back and forth and feel that there are no irregularities.
- 9) Preload procedure: put the slide on a clean surface on its side with the lateral preload set screws up. Follow step 1, 2 and 3 for the correct preload sequence.

Step 1. Start in the middle position and adjust the set screws with the recommended torque value, working outwards from the middle. Notice: Only adjust the screws directly above the cage.

Step 2. Move the slide top in one direction and adjust the set screws to the recommended torque value. (As given in table 1-5, page 23)

Step 3. Move the slide top in opposite position and repeat the adjusting for the screws which are now above the cages.

Again move the slide top back and forth a couple of times and feel that there are no irregularities.

- 10) Secure the attachment screws on the adjusting rail.
- 11) When assembly is complete, the linear bearings must be checked for absence of play and inspected for running quality.

● Available ● Not available

¹⁾ There are limitations to maximum rail length. Options available for standard grade, other quality grades on request

²⁾ Q2 quality grade only made to order

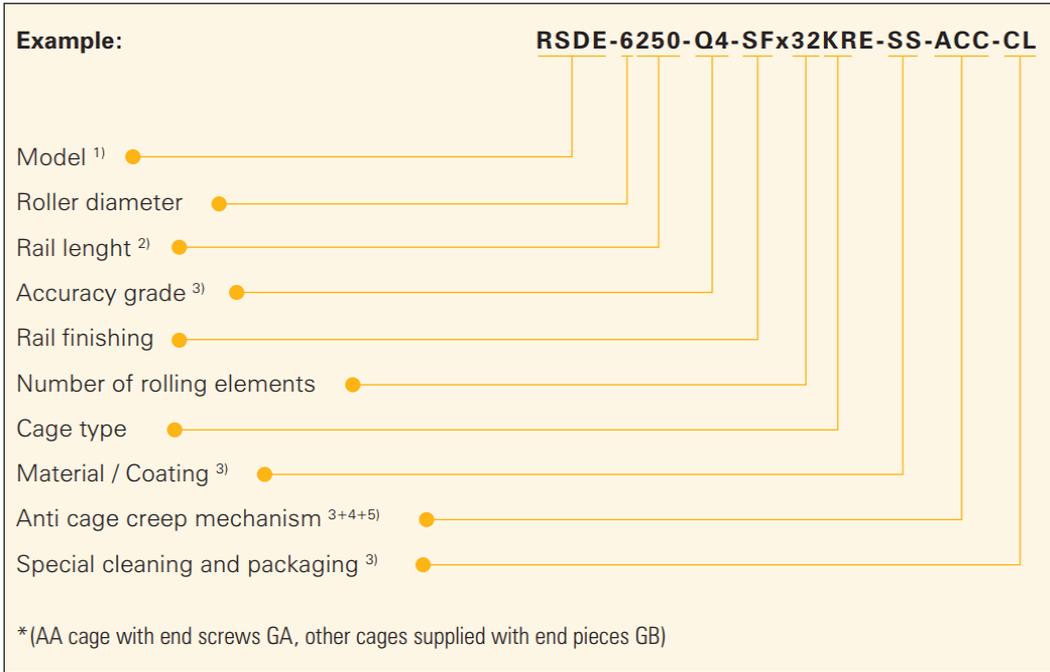

³⁾ Only available for linear bearings type RSDE made from stainless steel, max. length 240 mm

⁴⁾ Only available for linear bearings type M/V

ORDERING CODE LINEAR BEARINGS PACKED AS SET

One set includes: 4 rails + 2 roller cages + 8 end screws/end pieces

¹⁾ Type of rails RSD, RSDE and RNG

²⁾ Standard 4 rails of the same length

³⁾ No code, supplied as standard listed in the product tables

⁴⁾ Sets with ACC and ACCI are delivered without end pieces

⁵⁾ By order ACC and ACCI always indicate stroke length in order text

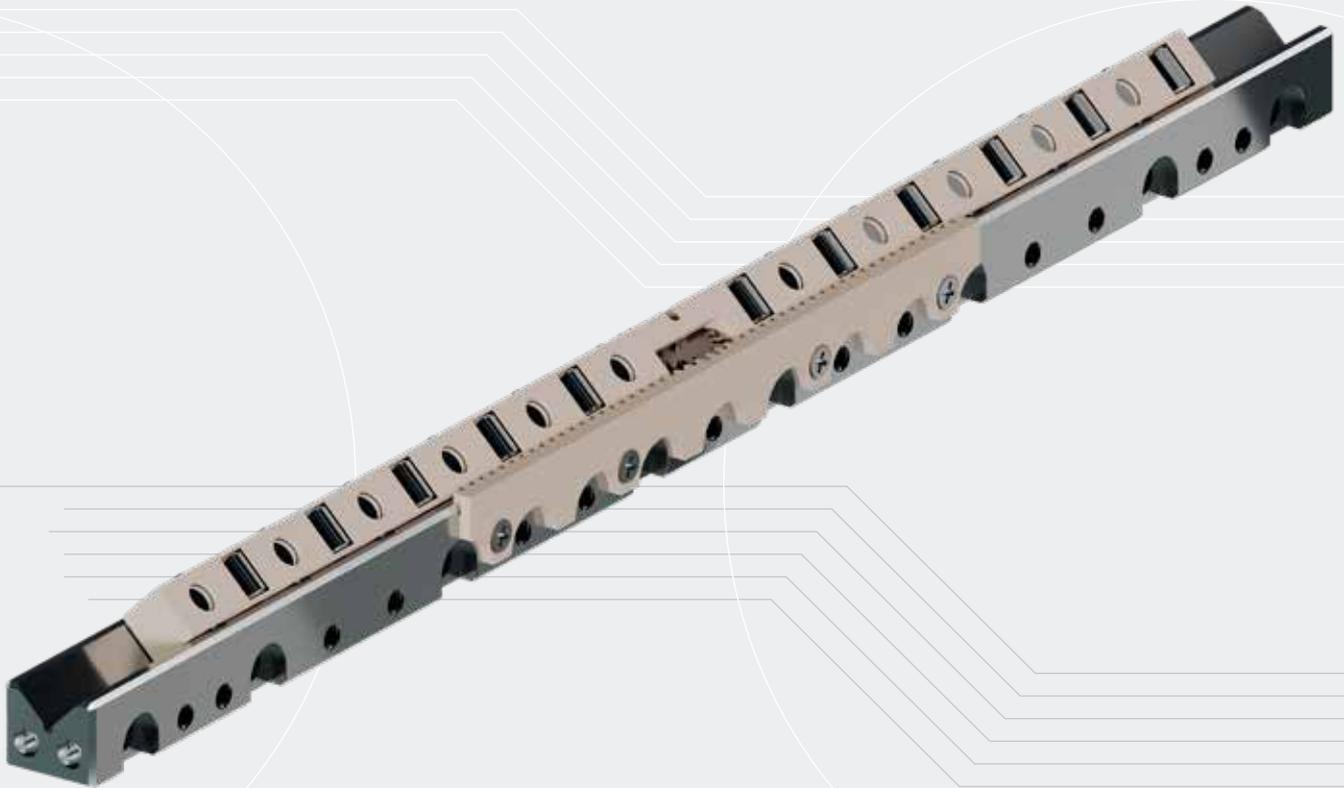

CUSTOMISED SOLUTIONS

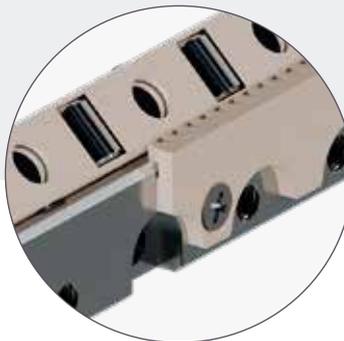

At PM we are experts in supplying linear bearings, frictionless slides and positioning stages to your unique application requirements. As a company with over 55 years' experience, our design engineers rely on deep industry know-how and state-of-the-art manufacturing facilities

to create the most technologically advanced and cost-effective solutions, custom-designed to even the most demanding specifications.

Please contact a PM product expert for more information.

CUSTOM HOLE DESIGN

CUSTOM ACC DESIGN

CUSTOM SIZE DESIGN

RSD linear bearings are compact rails designed for precise linear motion, offering high accuracy and exceptional reliability. Depending on the load requirements, they can be equipped with either ball or roller cages. Benefiting from many years of development, RSD linear bearings have become the global standard for high-tech applications that demand top-quality performance at minimal cost.

STRUCTURE AND FEATURES

Depending on the construction, the linear bearing can be equipped with ball or roller cages with alternately crossed rollers. The set consists of two pairs of linear bearings; one pair consists of two similar 90° V-groove rails, through-hardened and precision ground, equipped with a cage in between. Crossed roller cages are used in high load and high precision applications (note: good dust protection is required). Cages equipped with balls are used in applications requiring lower capacity, low friction resistance, or where dust and dirt are likely to gather in the rails. Balls are affected by dust and dirt to a lesser extent, owing to their self-cleaning properties.

Rails are equipped with countersunk attachment holes, bored according to a standard configuration.

Rail ends come with threaded holes for fixing end pieces and wipers.

For the attachment of the rails, special type GD screws are available to order separately (see page 39).

On request we supply linear bearings with roller size \varnothing 18 mm and \varnothing 24 mm. Please contact us for further information.

For long travel purpose type RSD rails can be combined with recirculating units type UK and UR, listed on page 99.

ORDER NOTES

One set linear bearing RSD consists of:
4 pcs. rails (=2 pairs), 2 pcs. cages and 8 pcs. end screws.

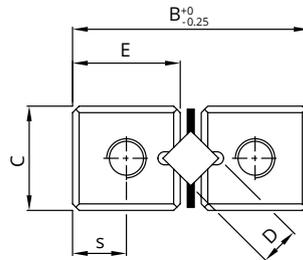

Please specify the following in your order:

- Quantity and type of rails
- Quantity, type and length of cages or max. stroke
- Direction of movement (eg: horizontal, vertical or in between)
- Quantity and type of end screws or end pieces with or without wipers (eg: in case of GC and GC-A, only 4 pieces are needed)

Example:

To order one linear bearing set of 300 mm length, size 6 mm for a 120 mm long horizontal stroke in standard quality please specify as follows:

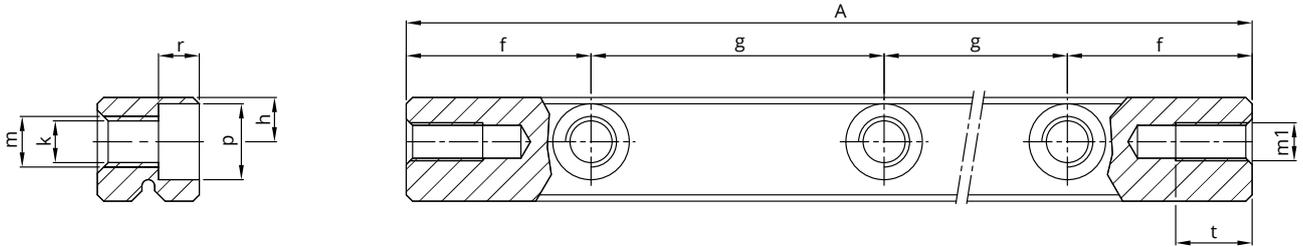

- 4 pcs. Rails type RSD-6300
- 2 pcs. Roller cages type R6x26AA
- 8 pcs. End screws type GA-6

ACCESSORIES

FOR LINEAR BEARINGS TYPE RSD AND DS

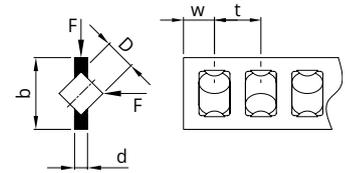

Roller cage type AA, size 1.5 - 15 mm

- Rollers retained
- For horizontal application
- Material steel, 1.5 - 6 mm cage material stainless steel 304

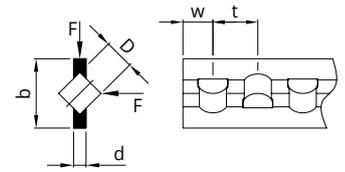

Roller cage type AL, size 4 - 15 mm

- Rollers retained
- For horizontal and vertical application
- Suitable for protruding cages
- Cage material aluminium

Roller cage type KZR, size 1.5 - 9 mm

- Rollers retained
- For horizontal and vertical application
- Cage material plastic (reinforced cages available in size 6 and 9 mm)
- Max. roller amount of 34 for 1.5 mm cages
- Only conditionally suitable for protruding cages

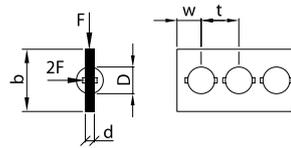

Cage type		Main dimensions					Accessories

LINEAR BEARING SET

User benefits

- Packaged as a set
- Standard stroke lengths*
- Ready for assembly, reducing cost
- Cages are straightened
- Short lead times
- Global standard
- All parts come pre-selected with stroke and load ratings

*Do you require longer stroke lengths? Roller cages can easily be shortened. Cage length should be at least 70% of the rail length.

Linear bearings set type RSD

Used by industries around the world, type RSD linear bearings provide high accuracy and superior reliability.

A standard set consists of:

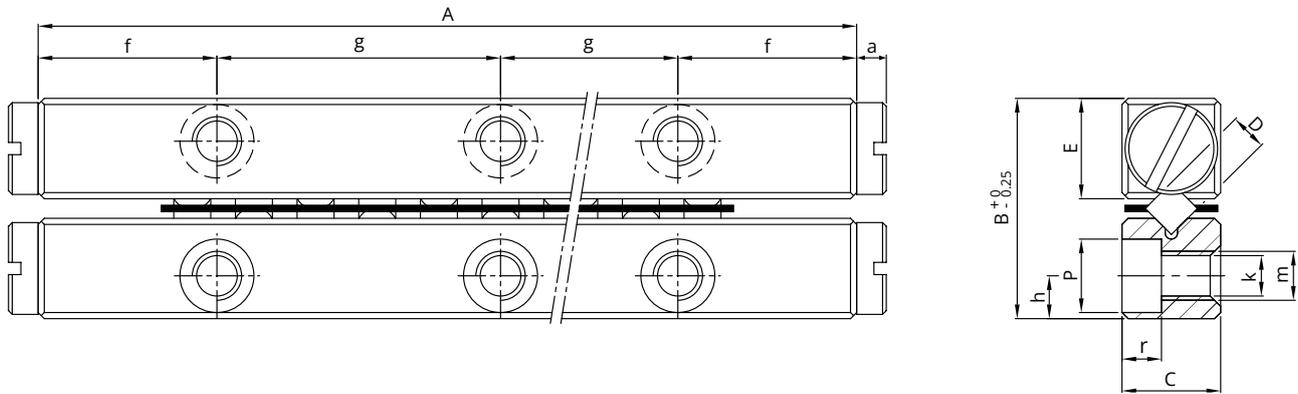

- 4 pcs. Rails type RSD
 - 2 pcs. Roller cages type AA
 - 8 pcs. End screws type GA inserted in the rail ends
- Packed and delivered as a set

Example: RSD-3100x14AA¹⁾

One set consists of:

- 4 pcs. Rails type RSD-3100
- 2 pcs. Roller cages type R3x14AA
- 8 pcs. End screws type GA-3

¹⁾To specify your detailed order, please follow the product code format as set out in the table in the table on page 25.

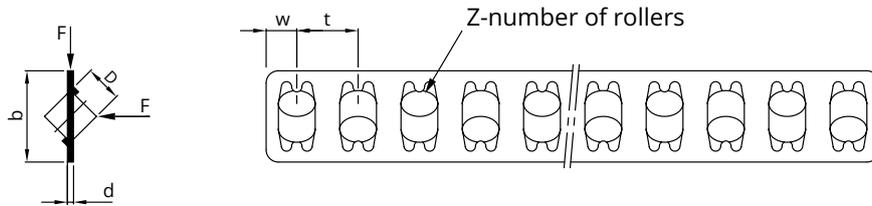

One set includes: 4 rails + 2 roller cages + 8 end screws

RSDE linear bearings are the next generation of the RSD type. The deeper V-groove, combined with high-density roller cages, provides increased load capacity and stiffness without altering the boundary dimensions of the rails. RSDE linear bearings are primarily used in highly dynamic applications that require high speed, precise running accuracy, and exceptional quality.

STRUCTURE AND FEATURES

The set consists of two pairs of linear bearings; one pair consists of two similar 90° V-groove, through-hardened and precision ground rails, equipped with a crossed roller cage in between (KRE cage: rollers retained). The rails come with countersunk attachment holes, according to standard configuration.

Key features are:

- Load capacity approx. 3 times that of a RSD linear bearing
- Stiffness increases by a factor 2, owing to the running surface's larger contact area (approx. 80% for a type RSDE, compared to 35% for conventional types)
- The design, with space between rails reduced to a minimum, prevents dust and dirt from entering the interior of the rails
- Designed for higher speeds and accelerations, with optional anti-cage creep solution

Roller cages are available in POM and PEEK material.

Rail ends have threaded holes compatible with type GA end screws.

For assembly of the rails, special type GD screws are available to order separately.

Anti-cage creep available on request, see page 72 - 75.

ORDER NOTES

One set of linear bearings RSDE consists of:
4 pcs. rails (= 2 pairs) RSDE, 2 pcs. cages KRE and 8 pcs. end screws with type GA screws.

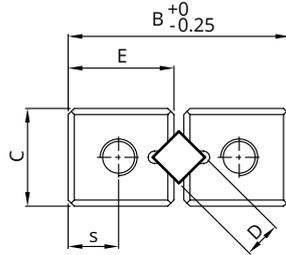

Please specify the following in your order note:

- Quantity and type of rails needed
- Quantity, type and length of cages or max. stroke
- Direction of movement (eg: horizontal, vertical or in between)
- Quantity and type of end screws needed

Example:

To order one linear bearing set of 125 mm length, size 3 mm for a 75 mm stroke in standard quality please specify as follows:

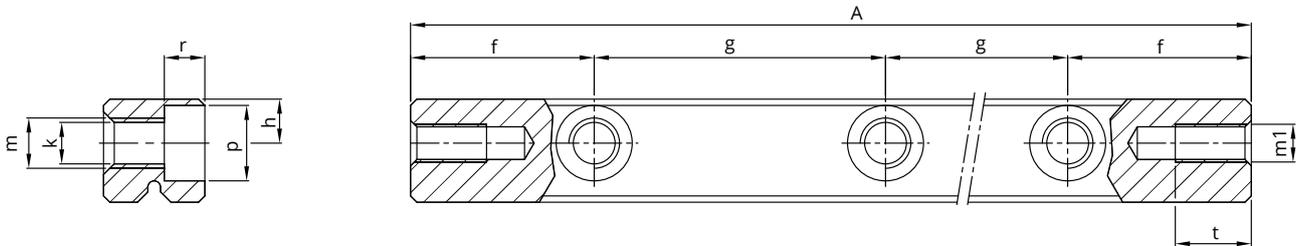

- 4 pcs. Rails type RSDE-3125
- 2 pcs. Roller cages type R3x26KRE
- 8 pcs. End screws type GA-3

LINEAR BEARINGS SET

User benefits

- Packaged as a set
- Standard stroke lengths*
- Ready to install, therefore cost-effective
- Roller cages are straightened
- Short lead times
- Global standard
- All parts come pre-selected with stroke and load ratings

*Do you require longer stroke lengths? Roller cages can easily be shortened. Cage length should be at least 70% of the rail length.

Linear bearings set type RSDE

Used by industries around the world, type RSDE linear bearings provide high accuracy, high load ratings and superior reliability. A standard set consists of:

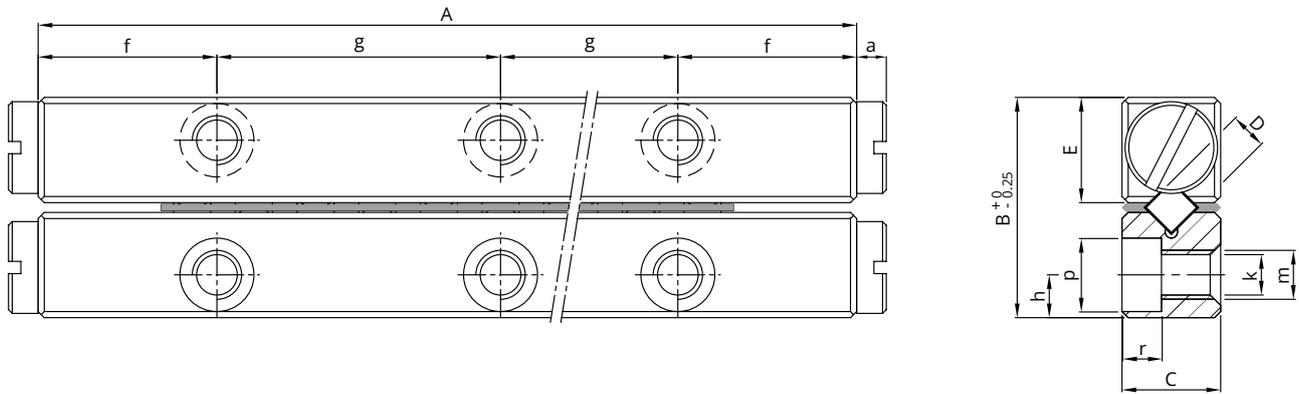

- 4 pcs. Rails type RSDE
 - 2 pcs. Roller cages type KRE
 - 8 pcs. End screws type GA inserted in the rail ends
- Packed and delivered as a set

Example: RSDE-4120x24KRE¹⁾

One set consists of:

- 4 pcs. Rails type RSDE-4120
- 2 pcs. Roller cages type R4x24KRE
- 8 pcs. screws type GA-4

¹⁾To specify your detailed order, please follow the product code format as set out in the table in the table on page 25.

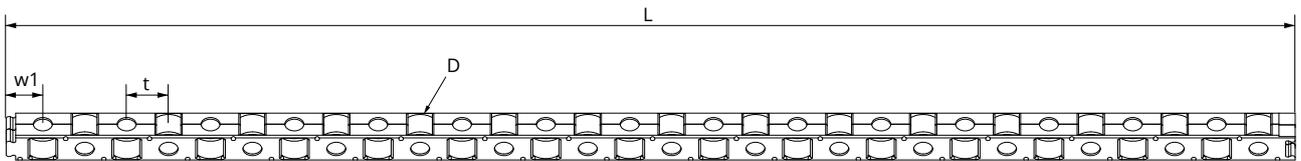

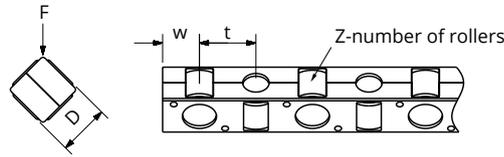

One set includes: 4 rails, 2 roller cages and 8 end screws

RNG linear bearings are compact, reliable, and designed for high load applications. The RNG linear bearings in sizes 4 and 6 are an advanced development of the RSDE type, offering improved mechanical characteristics. Significantly higher load capacities and stiffness are achieved, alongside more compact installation dimensions, thanks to the optimization of the groove's internal geometry.

STRUCTURE AND FEATURES

The set consists of two pairs of linear bearings; one pair consists of two similar 90° V-groove, through-hardened and precision ground rails, equipped with a crossed roller cage in between (KRE cage: rollers retained). The rails are equipped with countersunk attachment holes, according to a standard configuration.

Key features are:

- Load capacity approx. 30% higher than that of competitors
- **Compact design** with space between rails reduced to a minimum
- Designed for higher speeds and accelerations

Roller cages are available in POM or PEEK material.

Rail ends have threaded holes for fixing type GBN end pieces.

For assembly of the rails, special type GDN screws are available to order separately.

Anti-cage creep technology available on request, page 76 and 77.

ORDER NOTES

One set of linear bearings RNG consists of:
4 pcs. rails (=2 pairs) RNG, 2 pcs. cages KRE and 8 pcs. end pieces type GBN

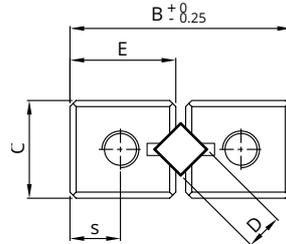

Please specify the following in your order note:

- Quantity and type of rails needed
- Quantity, type and length of cages or max. stroke
- Quantity and type of end pieces

Example:

To order one linear bearing set of 150 mm length, size 4 mm for a 60 mm stroke in standard quality please specify:

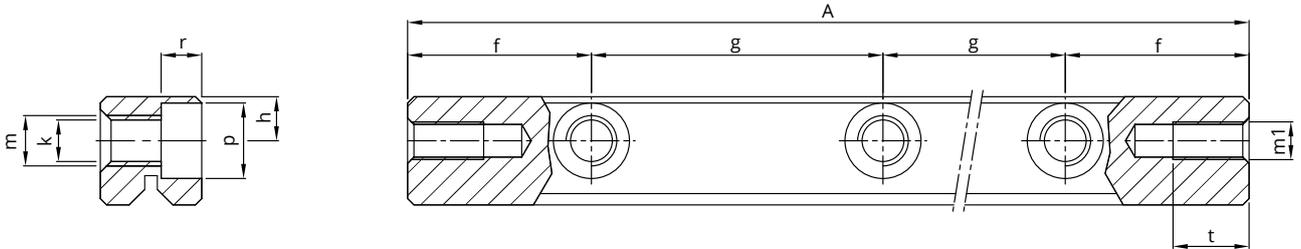

- 4 pcs. rails type RNG-4150
- 2 pcs. roller cages type R4x27KRE
- 8 pcs. end pieces type GBN-4

LINEAR BEARINGS SET

User benefits

- Packaged as a set
- Standard stroke lengths*
- Ready for assembly, therefore cost-effective
- Cages are straightened
- Short lead times
- Global standard
- Pre selection by load capacity and travel length

*Do you require longer stroke lengths? Roller cages can easily be shortened. Cage length should be at least 70% of the rail length.

¹⁾To specify your detailed order, please follow the product code format as set out in the table in the table on page 25.

Linear bearings set type RNG

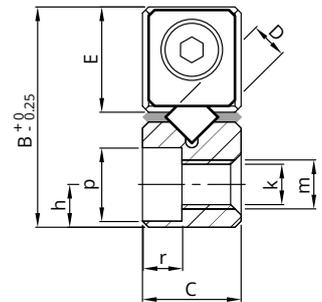

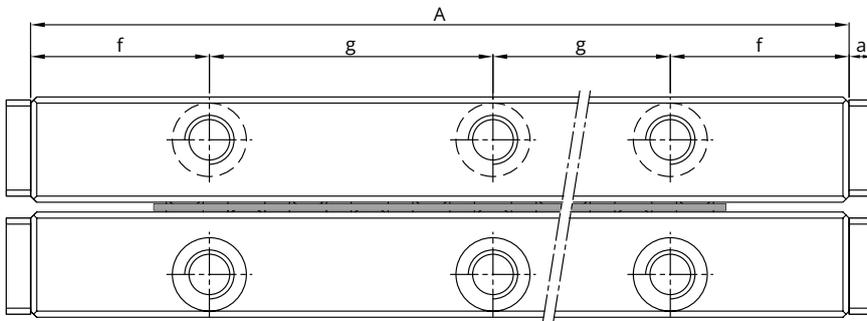

Used by industries around the world, high precision linear motion applications provide high accuracy and superior reliability with a compact design. A standard set consists of:

- 4 pcs. Rails type RNG
- 2 pcs. Roller cages type KRE
- 8 pcs. End pieces type GBN inserted in the rail ends
Packed and delivered as a set.

Example: RNG-4150x22KRE¹⁾

One set consists of:

- 4 pcs. Rails type RNG-4150
- 2 pcs. Roller cages type R4x22KRE
- 8 pcs. End pieces type GBN-4

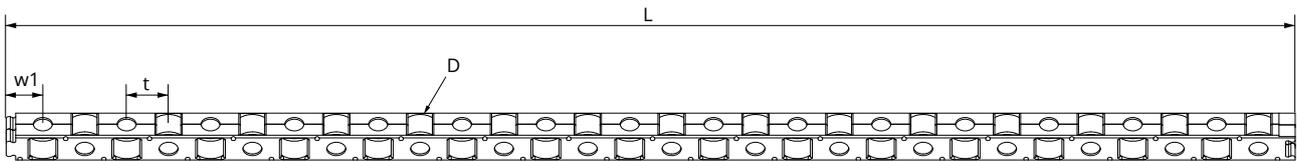

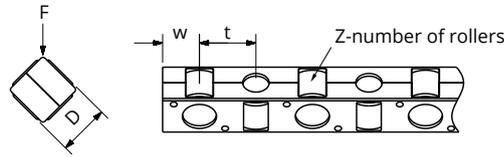

One set includes: 4 rails + 2 roller cages + 8 end pieces

ANTI-CAGE CREEP TECHNOLOGY

PM Anti-Cage Creep (ACC) technology reduces cage creep down to zero.

With high acceleration up to 15 g, the design is compact and cost-effective.

ACC is integrated in a crossed roller bearing design. Available also for stainless steel designs with an ECM-machined (Electro-Chemical Machining) integrated rack (ACCI all metal design) and UHV-compatibility.

A robust brass rack is locked in place inside the V-groove.

In its integrated form, anti-cage creep (ACCI) is ECM-machined and available for stainless steel rails and selected rail types only.

THE PROBLEM: CAGE CREEP

In the push for faster production times, machine designers are constantly striving for higher process speeds, reduced size and weight of designs, while simultaneously requiring the highest possible machine travel and positioning accuracy.

Cage creep can occur in non-recirculating linear bearing applications when there are vibrations, improper mounting, very high acceleration and deceleration, inadequate tolerances on the mounting surfaces, uneven preloading, or moment loading.

As the cage shifts from its original position, friction increases, travel length is reduced, and premature wear of the linear bearings occurs. This shortens the bearing's lifespan and can result in early failures.

OUR SOLUTION: ANTI-CAGE CREEP (ACC)

PM engineers have further enhanced ACC technology, making it suitable for high-tech and extremely dynamic applications. For decades, the ACC solution has demonstrated its superior ability to prevent cage creep in the most demanding applications and under the toughest conditions.

The ACC system is integrated into the linear bearing design without altering the external boundary or mounting dimensions. This allows a direct replacement of linear bearings in underperforming applications with the ACC solution.

PROVEN RECORD OF RESULTS

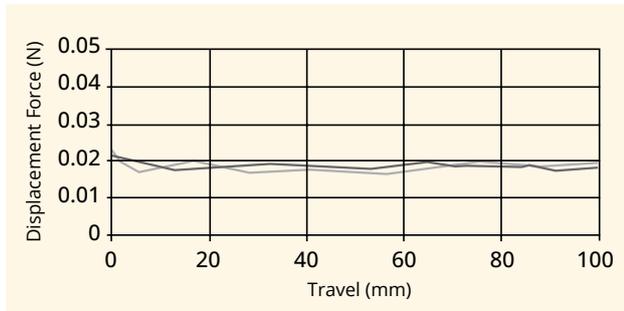

- No increase in friction
- No reduction in accuracy
- No adverse influence from lubrication
- Operational lifetime extended to its limit
- Zero cage creeping
- Works with all mounting applications
- Easy to assemble

The ACC system is the most effective and cost-efficient solution available on the market. Currently, our precision rails with optional ACC can be ordered with the RSDE and RNG series, in all accuracy grades.

FRICITION FORCE

The ACC solution is the result of a highly precise design and manufacturing process. The graph below illustrates that the force required to overcome friction remains virtually unchanged.

APPLICATIONS

The ACC solution is ideal for the high speed, high precision demands of the electronics and semiconductor industries, including applications such as wire bonding stages and pick-and-place units.

OPERATING TEMPERATURE

Linear bearings with the ACC solution can operate in temperatures ranging from -40 °C to +80 °C. This gives ACC a significant advantage over similar systems that use plastic components.

ACCELERATION

Max. acceleration 150 m/s² (15 g)

ONE ACC SET INCLUDES

A standard linear bearing set with ACC solution consists of:

- 4 pcs. rail type RSDE-ACC
- 2 pcs. roller cages type KRE(V)-ACC (rollers retained)

No end screws are required

Leading global manufacturers have chosen the ACC solution as the best available solution against cage creep.

Optional:

End screws type GA and attachment screws type GD.

The following products are available with anti-cage creep technology:

- Linear bearing sets RSDE
- Linear bearing sets RNG
- Miniature slides MSR

Units: mm

Linear needle roller bearings of the N/O and M/V types are ideal for the highly accurate support and guidance of heavy loads and moments. Due to their closely spaced needle rollers, they offer extremely high stiffness and precise linear motion. Their compact size makes them perfect for use in the machine tool industry.

STRUCTURE AND FEATURES

One set consists of 2 pairs of linear bearings; each pair consist of two rails, one N-type (female) and one O-type (male), through-hardened and precision ground, with one needle roller cage between them.

The rails are made to very high manufacturing tolerances and matched together as a set. Mixing components from different sets may adversely affect the accuracy.

Rails are equipped with countersunk attachment holes, according to standard configuration. Rail ends come with threaded holes for fixing end stops and wipers. Special type GD screws suitable for the attachment are available separately (see page 87 and 95).

ORDER NOTES

Normally, one set of linear bearing consists of:
4 pcs. rails (= 2 pairs) N/O, 2 pcs. needle cages and 8 pcs. endstops

Please make sure to specify the following product details in your order note:

- Quantity and type of rails needed
- Quantity and type of cages or max. stroke
- Quantity and type of end stop screws or end stop pieces with or without wipers

Please note that for end stop type GH with GH-A wipers, as well as end stop type GW with GW-A wipers, only 4 pieces are needed.

Example 1:

To order one linear bearing set of 600 mm length, size 2025 for a 350 mm stroke in standard quality please specify:

- 2 pcs. Rails type N-2025x600
- 2 pcs. Rails type O-2025x600
- 2 pcs. Needle cages type HW-15x425 mm
- 4 pcs. End pieces type GFN-2025
- 4 pcs. End pieces type GFO-2025

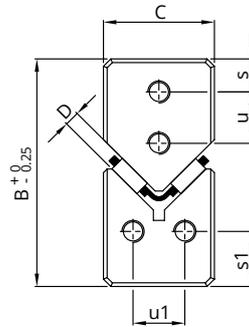

Example 2:

To order one linear bearing set of 300 mm length, size 3015 for a 150 mm stroke in standard quality specify as follows:

- 2 pcs. Rails type M-3015x300
- 2 pcs. Rails type V-3015x300
- 2 pcs. Needle cages type HW-10x225 mm
- 2 pcs. End pieces type EM-3015
- 2 pcs. End pieces type EAM-3015

ACCESSORIES

Needle cages type HW, size 10 - 30

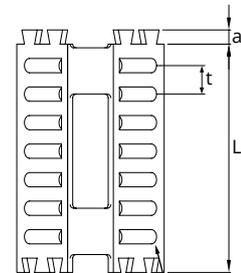

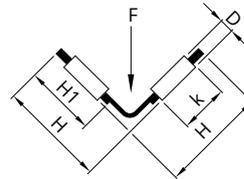

- Needles are retained
- Suitable for horizontal and vertical application
- Material aluminium
- Suitable for protruding cages
- Suitable for temperatures up to 150 °C
- On request we can supply cages in steel or brass

Length tolerance: $L +0/-t$

Needle cages type FF-ZW, size 2025 - 3555

- Needles are retained
- Suitable for horizontal and vertical application
- Material: plastic
- Suitable for temperatures up to 120 °C

Z-numbers of needles per row in one element

Features dovetail grooves on both sides of the cage elements for an easy connection of any number of elements. To bend the cage, heat the elements to 70 °C to 90 °C and bend to the desired angle.

1) The dynamic load rating C_{dyn} for a theoretical cage length of 100 mm in load direction "F" as shown in the drawings.

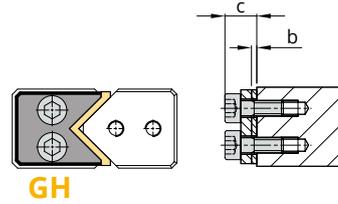

End pieces type GFN and GFO, size 62015 - 3555

- Suitable for horizontal and vertical application
- Fixing screws included

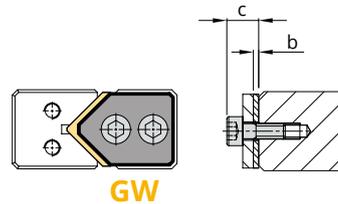

End pieces type GH, size 62015 - 3555

- Suitable for horizontal and vertical application
- Felt wipers type GH-A optionally available
- Fixing screws included

End pieces type GW, size 62015 - 3555

- For horizontal and vertical application
- Felt wipers type GW-A optionally available
- Fixing screws included

ACCESSORIES

Needle cages type HW, size 10 - 30

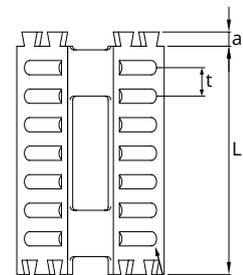

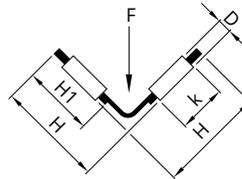

- Needles are retained
- Suitable for horizontal and vertical application
- Material aluminium
- For protruding cages
- Suitable for temperatures up to 150 °C
- On request we can supply cages in steel or brass

Length tolerance: $L +0/-t$

Needle cages type FF-ZW, size 2025 - 3555

- Needles are retained
- Suitable for horizontal and vertical application
- Material plastic
- Suitable for temperatures up to 120 °C

Z-numbers of needles per row in one element

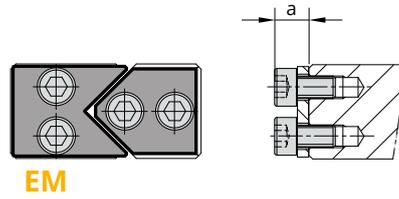

Features dovetail grooves on both sides of the cage elements for an easy connection of any number of elements. To bend the cage, heat the elements to 70 °C to 90 °C and bend to the desired angle.

Units: mm

DS double-sided V-groove rails are designed for use with RSD type linear bearings equipped with cages, offering space-saving solutions. They are also compatible with recirculating units UK and UR, enabling long-distance travel and a low profile design. Both V-grooves are parallel-machined to ensure precise linear motion and to eliminate installation and machining errors that can occur with the use of two single rails.

STRUCTURE AND FEATURES

Depending on the construction, the rail can be equipped with ball or roller cages in combination with RSD type of rails. Another popular combination is with recirculating units UK and UR for long travel and low profile design.

The double V-groove rails are made of tool steel 1.2842 and through-hardened at 58 - 62 HRC, finished by precision grinding. The rail include two dowel pin holes for precise positioning during assembly. No need for reference shoulders.

Rails are equipped with countersunk attachment holes, bored according to a standard configuration.

For the attachment of the rails, special type GD screws are available to order separately (see page 39).

As option the rail can be made from stainless steel.

For fitting dimensions of DS with RSD linear bearing type (see page 98), recirculating unit type UK/UR please see page 101.

For RSD bearings and corresponding cages please see pages 27 - 37.

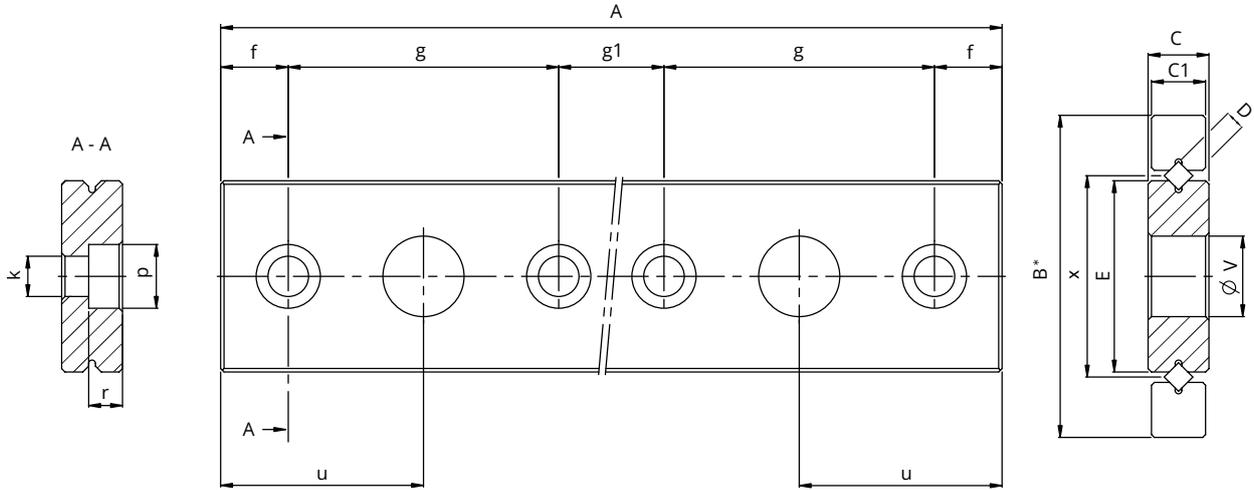

OPTIONAL FEATURES

- Stainless steel version
- Longer lengths as matched pairs
- Quality grades Q4 and Q2
- Special versions

Example:

To order one rail of size 6 mm with 300 mm length, please specify as follows:

- 1 pcs. Rail type DS-6300

*DS in combination with type RSD rails

Units: mm

Recirculating units UK are single-row ball bearings designed for low to medium loads. For greater load capacity and improved stiffness, we offer crossed roller recirculating units UR. These units are designed to function in any spatial orientation, and their precisely designed return mechanism ensures extremely smooth running characteristics.

STRUCTURE AND FEATURES

Recirculating units are made of high-quality bearing steel 1.2842, through-hardened at 58 - 62 HRC and precision ground. Through our unique construction method we achieve return channels and precision ground V-grooves that are sized to high levels of accuracy, making these linear bearings mechanisms an excellent choice. The units' openings are designed to retain the balls and rollers. Having thus removed the possibility of balls and rollers dropping out accidentally, installation and exchange of the recirculating unit has been made trouble-free.

The recirculating end caps are made of aluminium with black anodized finishing. The UK and UR types have identical mounting dimensions and are therefore interchangeable.

Every unit has a central hole for re-lubrication.

In conditions where dirt can enter the interior of the bearings the use of UK ball units is recommended since these are less sensitive to dirt compared to rollers.

The recirculation units can be mounted directly in the part of the structure to be moved. This makes it a very versatile solution with a low installation height.

The recirculating units can be connected directly to the adjacent construction or integrated into a carriage and thus integrated into the adjacent construction. This allows for very flexible solutions with a low overall height. The lateral arrangement of the recirculating units on the guide

rail creates a wide support distance. For installation dimensions of recirculating units with RSD rail, see pages 27 - 35. For installation with double-sided V-groove rails, see pages 97 and 98.

OPTIONAL FEATURES

- Stainless steel version
- UHV compatible version
- Ceramic rolling elements with damping spacers

Example:

To order two pieces of ball recirculating units size 3 mm with length 75 mm please specify:

- 2 pcs. UK-3075

Recirculating units type UR

PRODUCT OVERVIEW

PM slides are ready-to-install single-axis components with capacity for limited linear movement. These crossed roller slides use PM linear bearings type RSD come factory preloaded, thus assuring consistently high running accuracies, extremely low uniform friction coefficients, and long operating lifetimes. With a variety of models and a wide range of sizes available, the designer is given maximum flexibility to find an appropriate solution for all sorts of applications requiring linear movement.

Each type comes with attachment holes drilled to standard configurations, facilitating quick and easy assembly into your application. Thanks to their excellent running characteristics and proven solid reliability, these slides are the standard choice for factory automation in the general machine industry, including high-precision equipment. Custom designs can be supplied according to your specifications.

1. CROSSED ROLLER SLIDES TYPE RT / RTA

- Stroke lengths of 10 to 950 mm
- For highest accuracy performance
- Normal to high load capacity
- Steel, cast-iron or aluminum slide bodies
- Available in 6 standard sizes

2. DUST-PROTECTED SLIDES TYPE RTNG

- Stroke lengths of 10 to 250 mm
- Protection against dust and dirt
- For highest accuracy performances
- Steel and cast-iron slide bodies
- High rigidity

3. LOW PROFILE SLIDES TYPE RTS

- Stroke lengths of 12 to 130 mm
- For highest accuracy performance
- Low overall height with high stiffness
- Steel slide bodies
- Available in 3 standard sizes

4. MINIATURE BALL SLIDES TYPE PMM

- Stroke lengths of 5 to 70 mm
- Ultra-compact and lightweight design
- For rapid and precise movements
- Slide parts made of stainless steel
- Available in standard 3 sizes

5. MINIATURE CROSSED ROLLER SLIDES TYPE PMMR

- Stroke lengths of 5 to 70 mm
- All parts made of stainless steel
- For highest stiffness and accuracy requirements in the smallest of application spaces
- $V_{max} = 2 \text{ m/s}$, $a_{max} = 200 \text{ m/s}^2$ (20 g)
- C_{dyn} up to 1020 N

6. MINIATURE CROSSED ROLLER SLIDES TYPE MSR

- Including anti-cage creep mechanism
- • 7 sizes, including the world's smallest slide, size 3
- • Play-free, high repeatability
- • All parts made of stainless steel
- Stroke lengths of 5 – 112 mm

TECHNICAL DATA

ASSEMBLY

For each type the mounting holes are drilled to standard configuration in the slide top and slide base facilitating quick and easy installation into the application. Threaded holes in the slide parts are according to ISO-standards. Please note that dimensions listed in this catalogue are in mm.

Linear slides are precision devices; proper mounting is a prerequisite for their performance according to specifications. Slides must be mounted onto rigid, fine-machined (preferably fine-milled or grinded), flat surfaces and must be supported over their entire base length. Specifications as listed are only valid when these conditions are met.

REFERENCE SURFACE

The surface of the side opposite to the preload set screws is ground parallel to the slide axis and can therefore be used as a reference face for mounting the slide into the application.

OPERATING TEMPERATURE

Slides are capable of operating in a temperature range of $-30\text{ }^{\circ}\text{C}$ to $+120\text{ }^{\circ}\text{C}$. For slides which contain plastic components (plastic cages), the operating temperature range is $-30\text{ }^{\circ}\text{C}$ to $+80\text{ }^{\circ}\text{C}$.

MAXIMUM VELOCITY AND ACCELERATION

RTN / RTL, RTNG and RTS types crossed roller slides

Max. recommended speed $v = 50\text{ m/min}$.

Max. acceleration $a = 8\text{ m/sec}^2$.

PMM type ball miniature slides

Max. recommended speed $v = 50\text{ m/min}$.

Max. acceleration $a = 8\text{ m/sec}^2$.

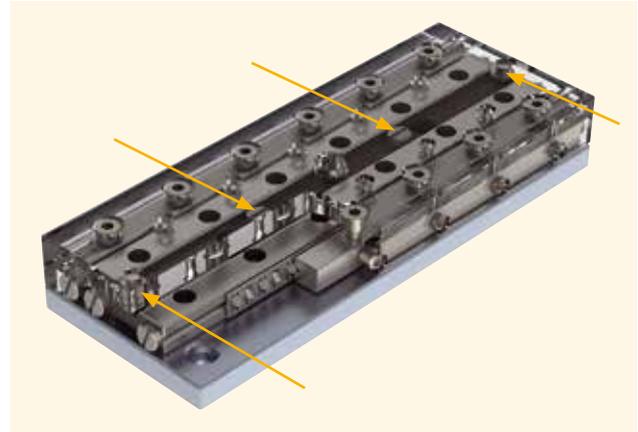

PMMR and MSR type crossed roller miniature slides

Max. recommended speed $v = 120\text{ m/min}$.

Max. acceleration $a = 200\text{ m/sec}^2$ (20 g).

INTERNAL STROKE LIMIT SCREWS

Crossed-roller slides RTN/RTL and RTNA/RTLA have internal stroke limit screws in the center line of the slides. These screws are for emergency use only and may not be used as a regular stroke end stop, as this can cause permanent damage to the linear bearings.

Example of location internal stroke limit screws

CAGE OPTIONS

The slides are delivered from the factory with crossed roller cages, which offer high load capacity and stiffness. However, some applications require ball cages because they are less sensitive to dust or when very low friction is needed. At PM, we can deliver the slides with ball cages upon request.

DELIVERED CONDITION

They are ready-to-use. The slides are factory preloaded by the use of lateral set screws and free of play. The amount of preload is approximately 10% of the dynamic load capacity. They are delivered with a small quantity of oil for lubrication which also protects the rails in the slides against corrosion. The quality grade of the crossed roller linear bearings which are used in the linear slides is in standard accuracy grade Q8.

The slides are free from stick-slip. The coefficient of friction range for slides fitted with balls or cylindrical rollers is 0.0005 to 0.003. PM slides are manufactured according the best manufacturing standards, offering high smoothness and precision of movement.

PMM, MSR and PMMR type of miniature slides are factory preloaded by means of geometry pairing.

SERVICE

The slides are factory preloaded and don't need readjustment. Depending on the application requirements the linear bearings need re-lubrication. There are no specific calculations to determine the lubrication intervals for linear bearings, thus it must be determined for each application.

However, we recommend a small quantity of lubrication at least twice a year for oil and at least once a year for grease. The lubrication can be applied to the linear bearings using the lateral gap between the rails. If this is not possible cause of the design of the machine we advise the use of special lubrication holes which can be added to the rails. If this is the case for you, please consult a PM advisor.

LOADS AND MOMENTS

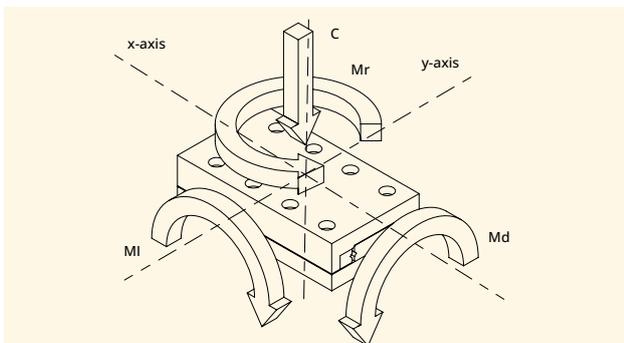

Slides listed in this catalogue are able to carry loads and moments in any direction. Load ratings are compliant with ISO and DIN standards for calculating roller bearings (ISO standard 281, for miniature slide type PMM DIN 636, part 3). To ensure high running accuracy and to prevent the occurrence of play, any vibration and overloading must be avoided.

Load capacity C , defined in ISO76-1987, is the maximum downward load or force located in the center of the upper part in horizontal zero-position.

M_I = Pitch moment: when a load is cantilevered (not symmetrically mounted) off the end of a slide, parallel to the direction of travel.

M_d = Roll moment: when a load is cantilevered off the side of a slide, perpendicular to the direction of travel.

M_r = Yaw moment: when a force causes a rotation moment around the centre of an axis. Exceeding of the listed moment ratings may reduce the lifetime of the bearings and can degrade accuracy. Please feel free to contact one of our product specialists for information.

STORAGE

Slides are precision components and need to be handled with great care. Slides are delivered in a package, special developed for optimum protection against external vibrations and contamination. For transport and storage use the original package. Slides should be stored at constant room temperature and under clean and dry conditions. Remove the slides from their packaging just before use.

VACUUM AND CLEANROOM COMPATIBLE

The majority of the slides can be prepared for use in (ultra-high) vacuum or cleanroom environments. Special care has to be taken, for example when selecting low outgassing materials, special lubricants, surface finishings, vented stainless steel fasteners for use in blind tapped holes, special ball- or crossed roller cages as well as switches and wires. Slides are assembled in our modern cleanroom cells certified to ISO/FDIS 14644-1 class 6 with cleanspots class 5.

NOTE ON DUAL USE

For applications requiring two or more slides to be mounted in parallel, please specify matched pairs (suffix MP) when ordering. Due to the slides high rigidity, special attention must be paid to the alignment and finish of adjacent surfaces. This ensures even load distribution, smooth operation, and reliable performance.

CUSTOMISED LINEAR SLIDES

In a situation that a standard product does not suit your application we offer customised product service. For example in:

- Special geometry
- Non-standard materials
- Customized cages
- Vacuum and UHV-compatibility
- Low till non-magnetic linear bearings
- Improved raceway surfaces
- Higher load ratings
- Higher speeds / accelerations

With over 55 years' experience we are well equipped and capable to fulfil your orders meeting even the most demanding requirements.

Please consult your PM advisor for more information.

www.PM.nl

Type RTN and RTL frictionless precision slides are preloaded linear motion units, ready for mounting. The proven design of this model offers a range of benefits, including high rigidity, no stick-slip, and unparalleled precision in linear movement due to the double-sided rail on the slide base, which eliminates machining errors.

SLIDE BODY MATERIALS

1, 2, 3 and 4 mm series are made of black oxide finished steel, while 6 and 9 mm series are available in cast-iron.

FEATURES AND SPECIFICATIONS

- Incorporates preloaded linear bearings type RSD and double-sided rail, including roller cages
- Slide top and slide base have equal lengths
- 2 standard stroke lengths (N and L stroke. Linear strokes are limited by internal mounted hard end stops, two in the slide top and one or two in the base-plate, depending on RTL or RTN version

RTN: for normal stroke/travel, with normal loads

RTL: for longer stroke/travel, with reduced loads

- Suitable for use in horizontal and vertical application
- All mounting surfaces are precision ground. One flank of the slide (i.e. the side opposite to the set screws) is ground parallel to the linear bearings to serve as a reference face
- The slide top is provided with tapped attachment holes, drilled to standard configuration. The slide base comes equipped with countersunk through holes, which accept socket head screws. Pre-drilled holes enable simple mounting
- The ends of the upper slide comes with tapped holes that permit easy attachment of covers, bellows, or other shields to prevent that contaminants enters the slide and keep the linear bearings clean
- For running accuracies please refer to page 150

OPTIONAL FEATURES

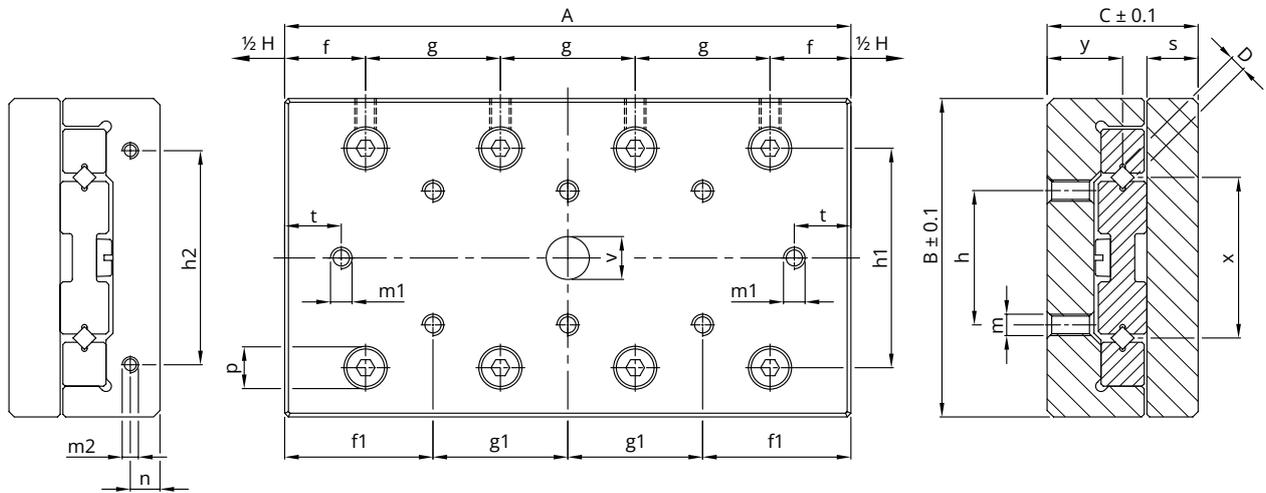

- Selected slides can be supplied with a height tolerance of ± 0.01 mm
- Cages can be replaced by plastic crossed roller type KZR or type KKLK equipped with balls
- Higher accuracy grade slides
- Stainless steel slide parts
- SF finishing for linear bearings offering smooth and ultra-precise operation
- UHV compatible version

ORDER NOTES

Please specify the following in your note:

- Model no. and quantity needed

Example: 1 piece slide type RTN-3100

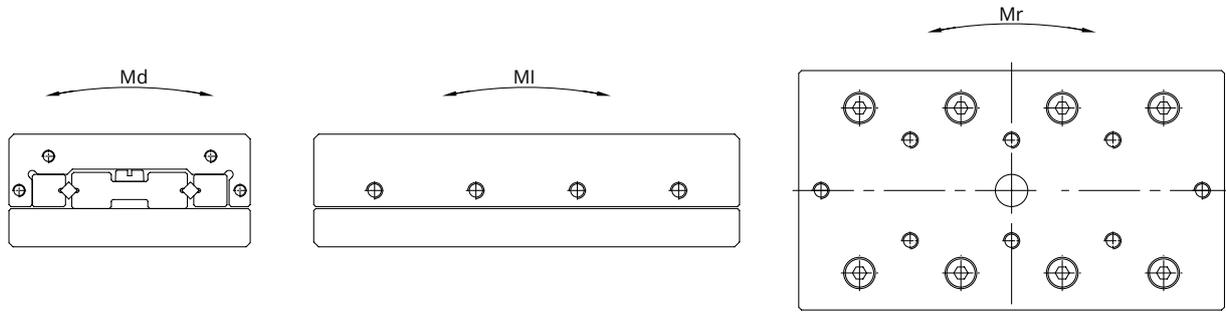

Please see drawings on page 112 and 113 for configuration of mounting holes in the slide base.

Units: mm

Frictionless slides type RTNA and RTLA are high-quality, preloaded linear motion units, ready for mounting. With aluminium as the primary material, these models offer numerous advantages, including low weight, no stick-slip effect, and ease of installation. These slides are designed to meet the demands of both the general machine industry and users of precision equipment.

SLIDE BODY MATERIALS

Aluminium, clear anodised finishing.

FEATURES AND SPECIFICATIONS

- Incorporates preloaded linear bearings type RSD and double-sided rail, including roller cages
- The slide top and slide base have equal lengths
- 2 standard stroke lengths (N and L stroke)
Linear strokes are limited by interior-mounted hard end stops, two in the base-plate, depending on **RTLA** or **RTNA** version
RTNA-stroke: for normal stroke/travel, with normal leads
RTLA-stroke: for longer stroke/travel, with reduced loads
- For horizontal and vertical application
- All mounting surfaces are precision ground. One flank of the slide (the side opposite to the adjustment screws) is ground parallel to the linear bearings to serve as a reference face
- The slide top is provided with tapped attachment holes, drilled to standard configuration. The slide base is equipped with countersunk through holes, which are compatible with socket head screws. Pre-drilled holes enable easy mounting
- The ends of the upper slide comes with tapped holes that permit easy attachment of covers, bellows, or other shields to prevent that contaminants enters the slide and keep the linear bearings clean
- For running accuracies please refer to page 150

OPTIONAL FEATURES

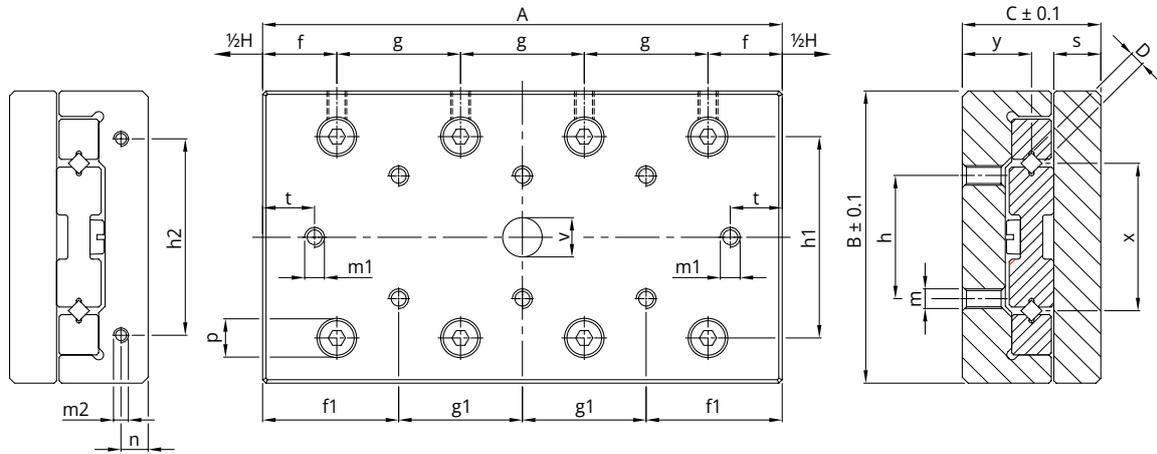

- Slides can be supplied with a height tolerance of ± 0.01 mm
- Cages can be replaced by plastic crossed roller type KZR or type KKLK equipped with balls
- Higher accuracy grade slides
- Stainless steel linear bearings, slide bodies in aluminium with natural or black anodised finishing, all fastening screws stainless steel
- SF finishing for linear bearings offering smooth and ultra-precise operation
- UHV-compatible version

ORDER NOTES

Please specify the following in your order note:

- Model no. and quantity needed

Example: 10 pcs. slide type RTNA-3175.

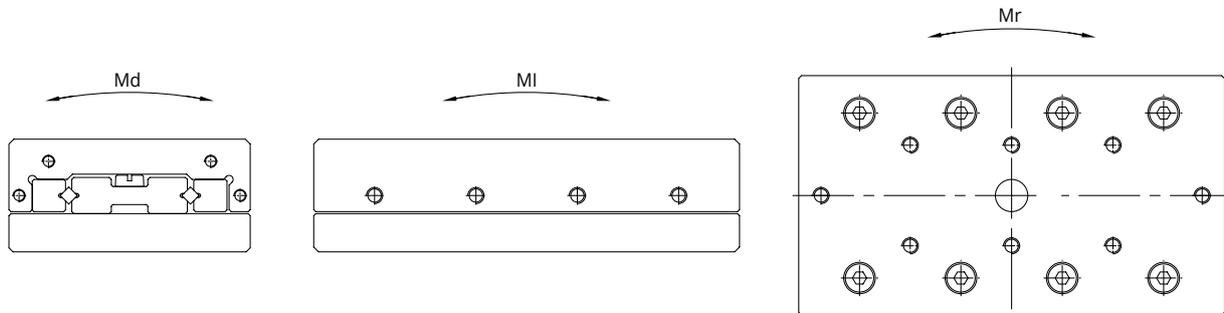

Please see drawings on page 120 and 121 for configuration of mounting holes in the slide base.

Type RTNG crossed roller slide offers protection against environmental contamination due to the narrow gap between the slide and base. Its other characteristics are similar to those of the RTN/RTL slides.

SLIDE BODY MATERIALS

Sizes 1.5, 2 and 3 mm: steel with black oxide finish.
 Sizes 6 and 9 mm are available in cast-iron.

FEATURES AND SPECIFICATIONS

- Incorporates preloaded linear bearings type RSD and double-sided rail, including roller cages
- Linear strokes are limited by the end plates. Please note it is not permitted to use these plates as hard stop / machine stop
- Roller cage material brass
- For horizontal and vertical applications
- The narrow gap between slide and base is approx. 0.08 mm in size
- All mounting surfaces are precision ground. One flank of the slide (the side opposite to the set screws) is ground parallel to the linear bearings to serve as a reference face
- The slide top and base are equipped with tapped attachment holes, drilled to a standard configuration enabling easy mounting
- For running accuracies please refer to page 150

OPTIONAL FEATURES

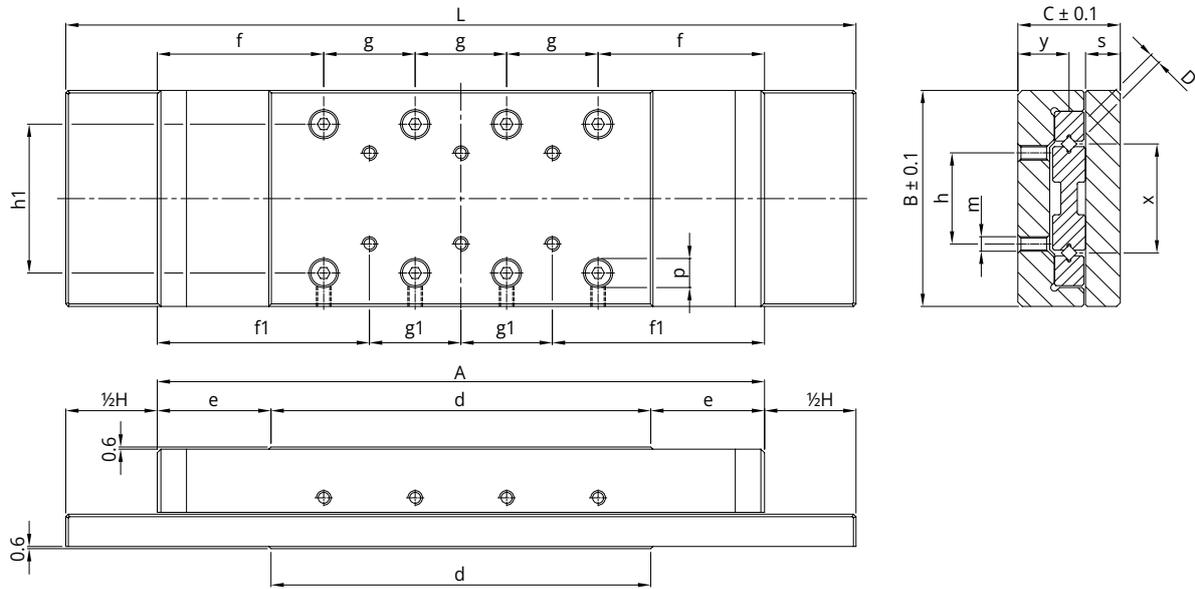

- Diam. 3, 6 and 9 mm can be delivered with dust-protected wipers and seals providing full covering, as shown at the top of page 125 and 127. Friction may be slightly higher as a result
- Selected slides can be supplied with a height tolerance of ± 0.01 mm
- Cages can be replaced by plastic crossed roller type KZR or type KCLK equipped with balls
- Higher accuracy grade slides
- Stainless steel version

ORDER NOTES

Please specify the following in your order note:

- Model no. and quantity needed

Example: 2 pcs. slide type RTNG-6200

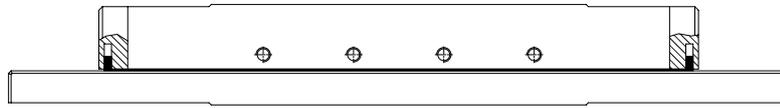

Please see drawing and table on page 128 and 129 for configuration of mounting holes in the slide base.

Frictionless type RTS low profile slides are high-quality, preloaded linear motion units, ready for mounting. This low profile type offers excellent motion accuracy and can carry medium loads and moments in any direction.

SLIDE BODY MATERIALS

Steel with black oxide finish.

FEATURES AND SPECIFICATIONS

- Available in 3 sizes
- Incorporates preloaded type RSD linear bearings and centre rail which act as slide base (through-hardened), including roller cages
- Slide top and centre rail have equal lengths
- Can be mounted in horizontal and vertical direction
- Roller cage material brass
- All mounting surfaces are precision ground. One flank of the slide (the side opposite to the set screws) is ground parallel to the linear bearings to serve as a reference face
- The slide top and base are equipped with tapped attachment holes, drilled to standard configuration enabling easy mounting
- For running accuracies please refer to page 150

OPTIONAL FEATURES

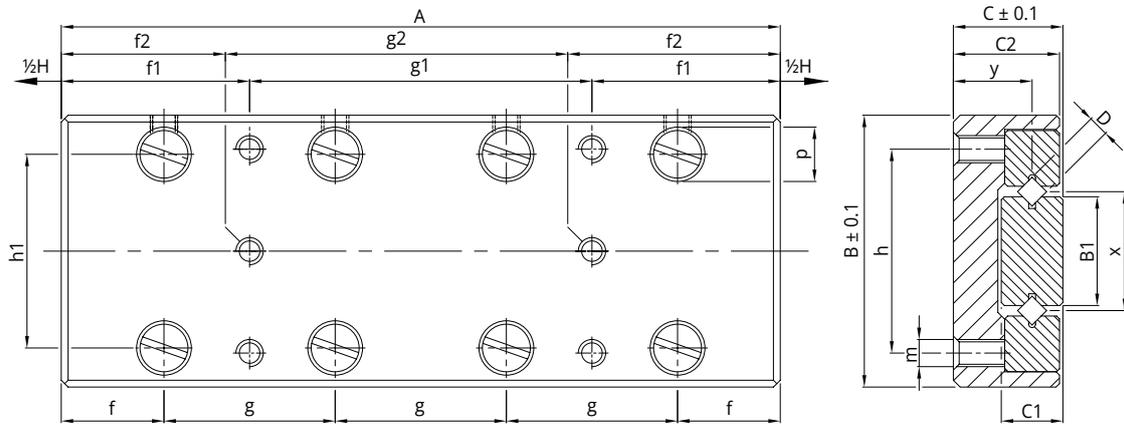

- Selected slides can be supplied with a height tolerance of ± 0.01 mm
- Cages can be replaced by plastic crossed roller type KZR or type KKLK equipped with balls
- Higher accuracy grade bearings
- Stainless steel version
- SF finishing for linear bearings for smooth and ultra-precision operation
- UHV compatible version

Units: mm

PMM miniature slides have been at the forefront of the global trend for reduced size and weight. These tiny slides are made of corrosion-resistant steel and offer consistently high motion accuracy and unsurpassed reliability. Due to their innovative design with 4-point ball contact, these slides exhibit extremely low friction resistance, smooth running characteristics, and long operating lifetimes.

MATERIALS

Slide parts and balls: stainless steel 1.4034, hardness 54 - 57 HRC. Ball cage brass / stainless steel.

FEATURES AND SPECIFICATION

- Available in 3 sizes
- Can be mounted in horizontal and vertical directions. The single-piece U-shaped cage makes the cage less likely to creep.
- The stroke is secured using internal screws
- Slide top and slide base have equal lengths
- All mounting surfaces are finished by means of precision grinding
- All slide flanks are ground parallel to the rails and can serve as reference faces
- The slide top and base have tapped attachment holes, drilled to standard configuration enabling easy mounting
- They are factory preloaded by means of geometry pairing
- For running accuracies please refer to page 150

OPTIONAL FEATURES

- Slides can be supplied with a height tolerance of ± 0.01 mm
- Defined push force
- UHV-compatible version
- Full stainless steel version

YEARS

of success

MICRO SLIDES MSR *"Industry's smallest crossed roller slide!"*

- Including anti-cage creep technology
- Smooth and precise motion
- Stroke range: 5 – 112 mm

- ① +65% Higher load
- ② 100% Stainless steel
- ③ High accelerations (20 G)
- ④ Prolonged lifetime and superior stiffness
- ⑤ Smart cage design offers maximum number of rollers

www.PM.nl

EQUIPPED
WITH
CROSSED
ROLLER

Higher speeds, excellent rigidity and durability, and limited enclosure—these are the challenges of today's industry. With the PMMR, we have achieved superior dynamics and precision in the smallest package possible. PMMR is the world's first miniature slide equipped with crossed roller technology.

MATERIALS

Slide parts and rollers: stainless steel 1.4034, hardness 54 - 57 HRC. Roller cage made of stainless steel.

FEATURES AND SPECIFICATION

- Available in 3 sizes
- All parts are made of stainless steel
- Can be mounted in horizontal and vertical position. Purposeley designed single-piece U-shaped cage prevents creeping of the cage and is limited by in motion hard stops
- Slide top and slide base have equal lengths
- All mounting surfaces are finished by precision grinding
- All side flanks are ground parallel to the rails and can serve as reference face
- Slide top and slide base have tapped attachment holes
- Maximum speed $V = 2 \text{ m/s}$
- Maximum acceleration $a = 200 \text{ m/s}^2$
- For running accuracies please refer to page 150

OPTIONAL FEATURES

- Slides can be supplied with a height tolerance of $\pm 0.01 \text{ mm}$
- Defined sliding force
- UHV-compatible version incl. lubricants
- Special versions
- Higher speeds / accelerations

Units: mm

Our newly developed miniature, corrosion-resistant MSR series slide is designed to meet the demands of tomorrow's industry. With faster cycle times, superior quality, and higher accuracy in a minimal space, the MSR series is the product of choice for precision applications that require constant exposure to high accelerations. All sizes include a robust anti-cage creep mechanism to provide reliable performance.

MATERIALS

Slide parts and rollers: stainless steel 1.4034, hardness 54- 57 HRC. Roller cage: stainless steel 304. Pinion and screws: stainless steel 303.

FEATURES AND SPECIFICATIONS

- Available in 7 sizes
- High density of crossed rollers for high load and rigidity
- Anti-cage creep included
- Play-free preloaded ex-factory
- Slide top and slide base have equal length
- All mounting surfaces are finished by precision grinding
- All side flanks are ground parallel to the rails and can serve as reference face
- Maximum speed $V = 2 \text{ m/s}$
- Maximum acceleration $a = 200 \text{ m/s}^2$
- For running accuracies please refer to page 150

OPTIONAL FEATURES

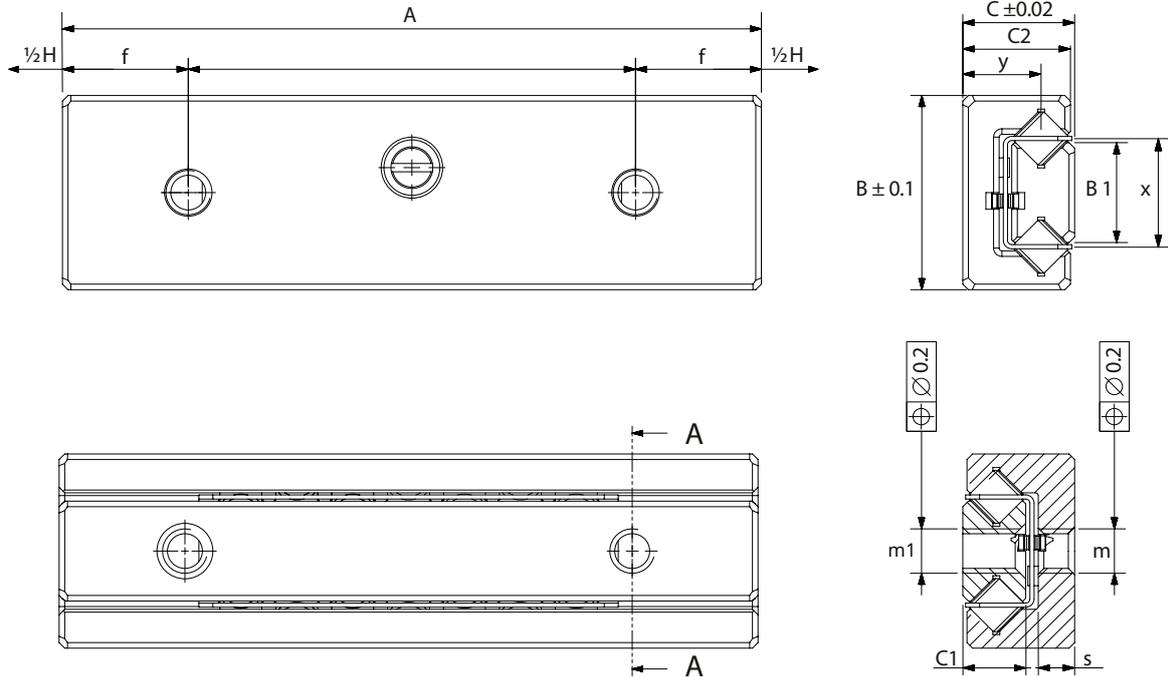

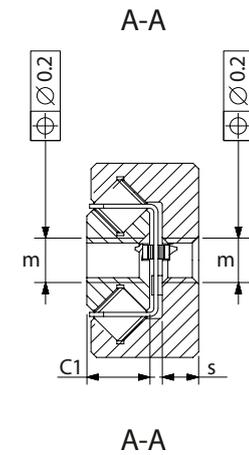

- Alternative lubricant
- Specified pushing force
- Custom designed table parts
- Customised stroke
- Additional holes
- Cleanroom or vacuum compatible

RUNNING ACCURACIES AND TOLERANCES

The table below shows the accuracies for different types of PM slides. Accuracies are measured with the slides in an unloaded horizontal position. The values shown are also applicable to 2-axis combinations. Where relevant, please refer to the appropriate stroke lengths.

In more complex cases, such as combinations of multiple axes, please contact us for expert support. Upon request, we can provide precision slides with a certificate of compliance based on laser accuracy measurements. Special higher accuracy grade slides are available upon request.

Tolerance on the height $+0.03\text{ mm} / -0.1\text{ mm}$ | Optional: Slides can be supplied with a height tolerance of $\pm 0.01\text{ mm}$

1. STRAIGHT LINE ACCURACY: this is the amount of error deviance from the ideal straight line of travel in the vertical plane.

2. FLATNESS ACCURACY: this is the amount of error deviance from the ideal straight line of travel in the horizontal plane.

PARALLISM IN μm , NEUTRAL POSITION ON SLIDE TOP: the parallelism of the slide surfaces occurs unloaded on a flat, horizontal surface in zero-position.

Type MT positioning slides are single-axis, micrometer-driven translation slides, designed for microscope-based inspection applications. MT slides feature crossed roller linear bearings that deliver excellent performance in terms of flatness, straightness, and repeatable positioning accuracy.

MATERIALS

Steel, nickel plated finishing.

Slide base is through-hardened, tool steel 1.2842.

FEATURES AND SPECIFICATION

- Incorporates precision crossed roller bearings
- Center driven by metric micrometer, scale 0.01 mm
- No backlash; positive spring-loaded carriage against micrometer tip for excellent repeatability and zero backlash. For Z-axis applications the spring-load must be taken into account. Please consult PM for expert advise
- Centre-bored hole for through light (not available in model type MT-1525)
- Slide type MT-1525 and MT-1535 are equipped with plastic roller cage type KZR. Other types are equipped with steel roller cage type AA
- All mounting surfaces are precision ground one flank of the slide (the side opposite to the set screws) is ground parallel to the linear bearings to serve as a reference face
- The slide top and base comes with threaded holes, according to a standard configuration
- For running accuracies please refer to page 154

OPTIONAL FEATURES

- Micrometers: digital (metric, imperial)
- Lockable micrometer (for type MT-2050 - MT-6150)
- XY assembly is without intermediate plate
Please use model code KMT (example KMT-2050)
- XYZ axis configurations with Z-bracket available
- Customer own design (drawing required)

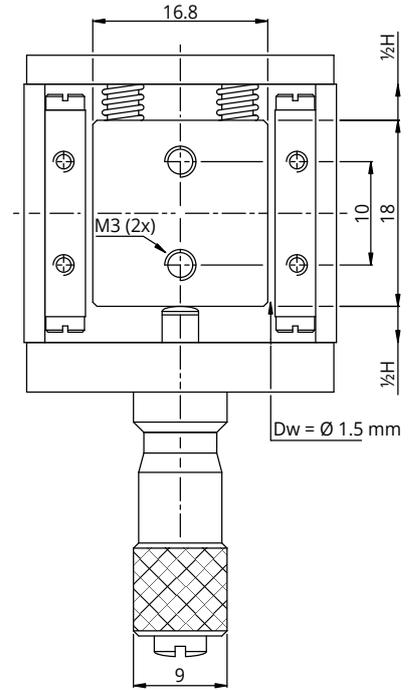

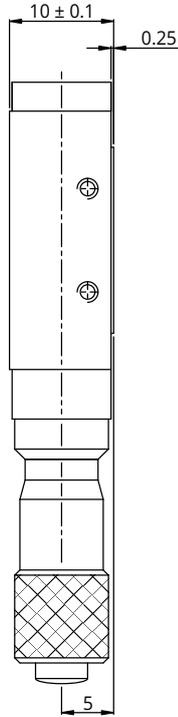

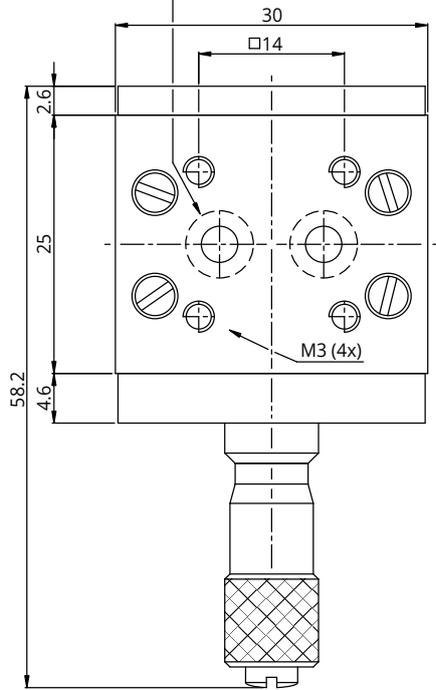

ORDER NOTES

Please specify the following in your order note:

- Model no. and quantity needed

Example: 1 piece slide type MT-1535

RUNNING ACCURACIES MT-SLIDES

The table below shows the accuracies for MT slides, measured in an unloaded horizontal position. The values provided are also applicable to 2-axis combinations. Where relevant, please refer to the appropriate stroke lengths.

In more complex cases, such as multi-axis combinations, please contact us for expert support. Upon request, we can provide MT slides with a certificate of compliance based on laser accuracy measurements. Special higher accuracy grade slides are available upon request.

	MT-1525	MT-1535	MT-2050	MT-2065	MT-3080	MT-3105	MT-6150
Travel (mm)	7	13	15	20	25	35	50
Straightness μm	2	2	2	2	3	3	4
Flatness μm	2	2	2	2	2	3	3
Pitch deviation (mrad)	0.1						
Roll deviation (mrad)	0.1						
Yaw deviation (mrad)	0.1						

Tolerance on the height: +0.03 mm / - 0.1 mm | Optional: MT slides can be supplied with a height tolerance of ± 0.01 mm. Orthogonality xy-assembly < 0.03 mrad.

1 μm = 1 micron is approximately 0.000040 inches.

The precision Flat Mounted Table Bearing (FMB) consists of two through-hardened standard bearing steel rings and a Teflon cage filled with precision-matched steel balls. The custom-designed ball groove increases load capacity and stiffness under moment loading, while ensuring high precision, longer service life, and a very low coefficient of friction. Pre-drilled attachment holes ensure easy installation.

MATERIAL

Rings and balls are made of bearing steel 1.3505, hardness 58 - 62 HRC. Ball cage material teflon.

FEATURES AND SPECIFICATION

- Low profile and space-saving design
- Simple installation thanks to pre-drilled attachment holes, the bearing can be installed on the mounting surface and tightened down by attachment screws
- Maintenance free teflon ball cage
- High load capacity: the custom developed gothic arc shaped V-groove, by virtue of its geometry, provides a greater contact area and high precision. They are factory preloaded by means of geometry pairing
- FMB bearings operate under different conditions and therefore supplied in two preload classes V0 (0.02C) and V1 (0.08C)
N-class: the industry standard
P-class: only available on request
- Space-saving design: This bearing is a great option for reducing the size of many types of precision rotary bearing systems. The FMB's compact design, as low as 8 mm in height, can replace a double back or face mounted angular contact bearing pair, constituting substantial savings in space and cost

OPTIONAL FEATURES

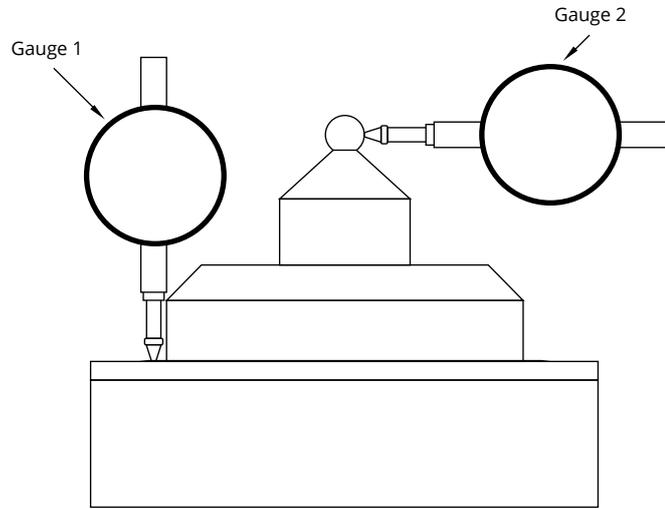

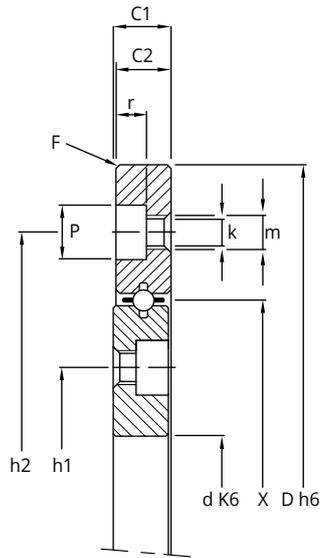

- Defined push force
- Outside diameters up to 500 mm
- Full stainless steel version
- Customised pre-drilled holes
- Crossed roller version
- Double row balls
- Special coatings such as Durni-coat to improve corrosion resistance
- UHV compatible version incl. lubricants
- Cleaning and packaging available according to various ISO cleanroom standards
- Defined preload

ORDER NOTES

Please specify the following in your order note:

- Model no. and quantity needed
- Preload class and precision class

Axial run-out (gauge 2): maximum axial variation of outer ring in comparison to the centre of rotation.

Eccentricity: also referred to as concentricity, defines the deviation of the centre of rotation from its mean position over one revolution.

Wobble (gauge 1): angular deviation of the axis of rotation over one revolution.

Regular = Long lead time item - please ask us about prices and lead times

CUSTOMISED PRODUCTS

Ball or roller diameter and preloaded precision concentricity guide.
Outer diameter sizes available up to 500 mm.
Please contact us for expert product advise.

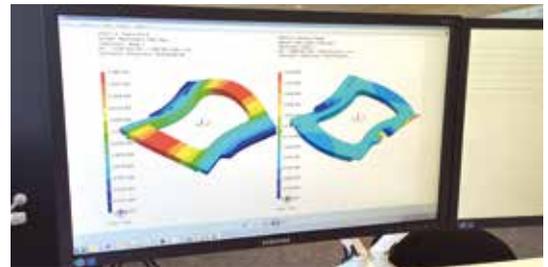

TAILORED TO CLIENT SPECIFICATIONS

At PM, we are committed to working closely with you to achieve the best possible results. We provide full lifetime product support, ensuring that your specific needs are met, even when they are complex. As a PM client, you can expect a highly collaborative and customer-focused approach in everything we do, from the initial prototype to large-scale production. We pride ourselves on delivering exceptional quality across all product groups. All PM products are designed and manufactured at our state-of-the-art facilities in the Netherlands, with your success as our top priority.
